Database documentation
In an effort to provide users with more timely information, with the April 2024 edition of the World Energy Balances database the IEA is releasing balances for those countries of the IEA Family (including OECD, Association and Accession countries) and beyond, for which data up to 2022 have been already received and validated.

This documentation provides support information for the April 2024 edition of the IEA World Energy Balances database. The July edition will cover the global set of data.

Please address your inquiries to stats@iea.org.
Please note that all IEA data is subject to the following Terms and Conditions found on the IEA's website: https://www.iea.org/terms

Changes from last edition

Geographical coverage

The countries, territories and economies included are:

**OECD:** Australia, Austria, Belgium, Canada, Chile, Colombia, Costa Rica, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Korea, Latvia, Lithuania, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Poland, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Republic of Türkiye, United Kingdom, United States;

**Accession countries:** Chile, Colombia, Costa Rica, Israel and Latvia;

**Association countries:** Argentina, Brazil, People’s Republic of China, Egypt, India, Indonesia, Kenya, Morocco, Senegal, Singapore, South Africa, Thailand, Ukraine;

**Other selected countries and economies:** Albania, Algeria, Azerbaijan, Bosnia and Herzegovina, Bulgaria, Croatia, Curaçao, Cyprus, Ecuador, Georgia, Ghana, Honduras, Hong Kong (China), Kosovo, Malta, Mauritius, Republic of Moldova, Montenegro, Republic of North Macedonia, Paraguay, Romania, Serbia, Tunisia, Uzbekistan, Zambia;

Latvia is currently seeking accession to full IEA membership (Accession country). Accordingly, Latvia is included in the IEA and Accession/Association countries aggregate (IEAFAMILY) for data starting in 1990.

Costa Rica is currently seeking accession to full IEA membership (Accession country). Accordingly, Costa Rica is included in the IEA and Accession/Association countries aggregate (IEAFAMILY) for data starting in 1971.

For further details, please refer to the section on *Geographical coverage*. 
Database structure

The database *World Energy Balances* includes annual data for:

- **countries**: 76 countries and 9 regional aggregates
  (see section Geographical coverage);
- **years**: 1960-2022 (OECD countries);
  1971-2022 (non-OECD countries and regional aggregates).

The database includes the following four files:

**WBAL.IVT**  **Summary energy balances**
Energy balances in matrix form (19 product categories; 80 flows)
(ktoe; TJ); Electricity and heat output by type of producer (10 flows)
(GWh; TJ; ktoe).

**WBIG.IVT**  **Extended energy balances**
Energy balances in matrix form (68 products and 98 flows) (ktoe; TJ); Electricity
and heat output by type of producer (10 flows) (GWh; TJ; ktoe).

**WIND.IVT**  **Indicators**
83 energy, economic and coupled indicators (various units).

**WCONV.IVT**  **World conversion factors**
net calorific values by flow for 15 coal products (toe/t; kJ/kg); average net
calorific values for 23 oil products and 5 biofuel products (toe/t; kJ/kg); volume to
mass ratio for 22 oil products and 4 biofuel products (barrels/tonne); gross
calorific values by flow for natural gas (kJ/m³).

Detailed definitions of each flow and product are presented in sections *Flow definitions* and *Product definitions.*
## Flow definitions

### Supply

<table>
<thead>
<tr>
<th>Flow</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Production</td>
<td>INDPROD</td>
<td>Comprises the production of primary energy, i.e. hard coal, lignite, peat, crude oil, NGLs, natural gas, biofuels and waste, nuclear, hydro, geothermal, solar and the heat from heat pumps that is extracted from the ambient environment (only heat generated from heat pumps that is sold to third parties is included in the energy balance). Production is calculated after removal of impurities (e.g. sulphur from natural gas). Calculation of production of hydro, geothermal, etc. and nuclear electricity is explained in section <em>Units and conversions</em>.</td>
</tr>
<tr>
<td>Imports</td>
<td>IMPORTS</td>
<td>Comprise amounts having crossed the national territorial boundaries of the country whether or not customs clearance has taken place. For coal: Imports comprise the amount of fuels obtained from other countries, whether or not there is an economic or customs union between the relevant countries. Coal in transit should not be included. For oil and natural gas: Quantities of crude oil and oil products imported under processing agreements (i.e. refining on account) are included. Quantities of oil in transit are excluded. Crude oil, NGL and natural gas are reported as coming from the country of origin; refinery feedstocks and oil products are reported as coming from the country of last consignment. Imported LNG which is exported to another country after regasification is considered both as an import and as an export of gas. For electricity: Amounts are considered as imported when they have crossed the national territorial boundaries of the country. If electricity is “wheeled” or transited through a country, the amount is shown as both an import and an export.</td>
</tr>
<tr>
<td>Exports</td>
<td>EXPORTS</td>
<td>Comprise amounts having crossed the national territorial boundaries of the country whether or not customs clearance has taken place. For coal: Exports comprise the amount of fuels supplied to other countries, whether or not there is an economic or customs union between the relevant countries. Coal in transit should not be included. For oil and natural gas: Quantities of crude oil and oil products exported under processing agreements (i.e. refining on account) are included. Re-exports of oil imported for processing within bonded areas are shown as an export of product from the processing country to the final destination. Imported LNG which is exported to another country after regasification is considered both as an import and as an export of gas. For electricity: Amounts are considered as exported when they have crossed the national territorial boundaries of the country. If electricity is “wheeled” or transited through a country, the amount is shown as both an import and an export.</td>
</tr>
<tr>
<td>International marine bunkers</td>
<td>MARBUNK</td>
<td>Covers those quantities delivered to ships of all flags that are engaged in international navigation. The international navigation may take place at sea, on inland lakes and waterways, and in coastal waters. Consumption by ships engaged in domestic navigation is excluded. The domestic/international split is determined on the basis of port of departure and port of arrival, and not by the flag or nationality of the ship. Consumption by fishing vessels and by military forces is also excluded. See <em>domestic navigation, fishing and non-specified (other)</em>.</td>
</tr>
</tbody>
</table>
### Flow | Short name | Definition
--- | --- | ---
International aviation bunkers | AVBUNK | Includes deliveries of aviation fuels to aircraft for international aviation. Fuels used by airlines for their road vehicles are excluded. The domestic/international split should be determined on the basis of departure and landing locations and not by the nationality of the airline. For many countries this incorrectly excludes fuel used by domestically owned carriers for their international departures. *International aviation bunkers are excluded from the supply at the country and regional level, but not for world, where they are included in transport under World aviation bunkers.*

Stock changes | STOCKCHA | Reflects the difference between opening stock levels on the first day of the year and closing levels on the last day of the year of stocks on national territory held by producers, importers, energy transformation industries and large consumers. A stock build is shown as a negative number, and a stock draw as a positive number.

Total energy supply | TES | Total energy supply (TES) is made up of production + imports - exports - international marine bunkers - international aviation bunkers ± stock changes. Note, exports, bunkers and stock changes incorporate the algebraic sign directly in the number. For World, TES is defined as production + imports - exports ± stock changes. Note, exports, bunkers and stock changes incorporate the algebraic sign directly in the number.

Transfers | TRANSFER | Comprises *interproduct transfers, products transferred* and *recycled products*. *Interproduct transfers* results from reclassification of products either because their specification has changed or because they are blended into another product, e.g. kerosene may be reclassified as gasoil after blending with the latter in order to meet its winter diesel specification. The net balance of *interproduct transfers* is zero. *Products transferred* is intended for oil products imported for further processing in refineries. For example, fuel oil imported for upgrading in a refinery is transferred to the feedstocks category. *Recycled products* are finished products which pass a second time through the marketing network, after having been once delivered to final consumers (e.g. used lubricants which are reprocessed).

Statistical differences | STATDIFF | Includes the sum of the unexplained statistical differences for individual fuels, as they appear in the basic energy statistics. It also includes the statistical differences that arise because of the variety of conversion factors in the coal and oil columns.
### Transformation processes

<table>
<thead>
<tr>
<th>Flow</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transformation processes</td>
<td>TOTTRANF</td>
<td>Transformation processes comprise the conversion of primary forms of energy to secondary and further transformation (e.g. coking coal to coke, crude oil to oil products, and fuel oil to electricity). Inputs to transformation processes are shown as negative numbers and output from the process is shown as a positive number. Transformation losses will appear in the “total” column as negative numbers.</td>
</tr>
<tr>
<td>Main activity producer electricity plants</td>
<td>MAINELEC</td>
<td>Refers to plants which are designed to produce electricity only. If one or more units of the plant is a CHP unit (and the inputs and outputs cannot be distinguished on a unit basis) then the whole plant is designated as a CHP plant. Main activity producers generate electricity for sale to third parties, as their primary activity. They may be privately or publicly owned. Note that the sale need not take place through the public grid.</td>
</tr>
<tr>
<td>Autoproducer electricity plants</td>
<td>AUTOELEC</td>
<td>Refers to plants which are designed to produce electricity only. If one or more units of the plant is a CHP unit (and the inputs and outputs cannot be distinguished on a unit basis) then the whole plant is designated as a CHP plant. Autoproducer undertakings generate electricity wholly or partly for their own use as an activity which supports their primary activity. They may be privately or publicly owned.</td>
</tr>
<tr>
<td>Main activity producer CHP plants</td>
<td>MAINCHP</td>
<td>Refers to plants which are designed to produce both heat and electricity (sometimes referred to as co-generation power stations). If possible, fuel inputs and electricity/heat outputs are on a unit basis rather than on a plant basis. However, if data are not available on a unit basis, the convention for defining a CHP plant noted above should be adopted. Main activity producers generate electricity and/or heat for sale to third parties, as their primary activity. They may be privately or publicly owned.</td>
</tr>
<tr>
<td>Autoproducer CHP plants</td>
<td>AUTOCHP</td>
<td>Refers to plants which are designed to produce both heat and electricity (sometimes referred to as co-generation power stations). If possible, fuel inputs and electricity/heat outputs are on a unit basis rather than on a plant basis. However, if data are not available on a unit basis, the convention for defining a CHP plant noted above should be adopted. Note that for autoproducer CHP plants, all fuel inputs to electricity production are taken into account, while only the part of fuel inputs to heat sold is shown. Fuel inputs for the production of heat consumed within the autoproducer's establishment are not included here but are included with figures for the final consumption of fuels in the appropriate consuming sector. Autoproducer undertakings generate electricity and/or heat, wholly or partly for their own use as an activity which supports their primary activity. They may be privately or publicly owned.</td>
</tr>
<tr>
<td>Main activity producer heat plants</td>
<td>MAINHEAT</td>
<td>Refers to plants (including heat pumps and electric boilers) designed to produce heat only and who sell heat to a third party (e.g. residential, commercial or industrial consumers) under the provisions of a contract. Main activity producers generate heat for sale to third parties, as their primary activity. They may be privately or publicly owned. Note that the sale need not take place through the public grid.</td>
</tr>
<tr>
<td>Flow</td>
<td>Short name</td>
<td>Definition</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Autoproducer heat plants</td>
<td>AUTOHEAT</td>
<td>Refers to plants (including heat pumps and electric boilers) designed to produce heat only and who sell heat to a third party (e.g. residential, commercial or industrial consumers) under the provisions of a contract. Autoproducer undertakings generate heat, wholly or partly for their own use as an activity which supports their primary activity. They may be privately or publicly owned.</td>
</tr>
<tr>
<td>Heat pumps</td>
<td>THEAT</td>
<td>Includes heat produced by heat pumps in transformation. Heat pumps that are operated within the residential sector where the heat is not sold are not considered a transformation process and are not included here – the electricity consumption would appear as residential use.</td>
</tr>
<tr>
<td>Electric boilers</td>
<td>TBOILER</td>
<td>Includes electric boilers used to produce heat.</td>
</tr>
<tr>
<td>Chemical heat for electricity production</td>
<td>TELE</td>
<td>Includes heat from chemical processes that is used to generate electricity.</td>
</tr>
<tr>
<td>Blast furnaces</td>
<td>TBLASTFUR</td>
<td>Includes the production of recovered gases (e.g. blast furnace gas and oxygen steel furnace gas). The production of pig-iron from iron ore in blast furnaces uses fuels for supporting the blast furnace charge and providing heat and carbon for the reduction of the iron ore. Accounting for the calorific content of the fuels entering the process is a complex matter as transformation (into blast furnace gas) and consumption (heat of combustion) occur simultaneously. Some carbon is also retained in the pig-iron; almost all of this reappears later in the oxygen steel furnace gas (or converter gas) when the pig-iron is converted to steel. In the 1992/1993 annual questionnaires, member countries were asked for the first time to report in transformation processes the quantities of all fuels (e.g. pulverised coal injection [PCI] coal, coke oven coke, natural gas and oil) entering blast furnaces and the quantity of blast furnace gas and oxygen steel furnace gas produced. The IEA Secretariat then needed to split these inputs into the transformation and consumption components. The transformation component is shown in the row blast furnaces in the column appropriate for the fuel, and the consumption component is shown in the row iron and steel, in the column appropriate for the fuel. The IEA Secretariat decided to assume a transformation efficiency such that the carbon input into the blast furnaces should equal the carbon output. This is roughly equivalent to assuming an energy transformation efficiency of 40%.</td>
</tr>
<tr>
<td>Gas works</td>
<td>TGASWKS</td>
<td>Includes the manufacture of town gas. Note: in the summary balances this item also includes other gases blended with natural gas (TBLENDGAS).</td>
</tr>
<tr>
<td>Coke ovens</td>
<td>TCOKEOVS</td>
<td>Includes the manufacture of coke and coke oven gas.</td>
</tr>
<tr>
<td>Patent fuel plants</td>
<td>TPATFUEL</td>
<td>Includes the manufacture of patent fuels.</td>
</tr>
<tr>
<td>BKB/peat briquette plants</td>
<td>TBKB</td>
<td>Includes the manufacture of BKB and peat briquettes.</td>
</tr>
<tr>
<td>Oil refineries</td>
<td>TREFINER</td>
<td>Covers the use transformation of hydrocarbons for the manufacture of finished oil products.</td>
</tr>
<tr>
<td>Petrochemical plants</td>
<td>TPETCHEM</td>
<td>Covers backflows returned from the petrochemical industry. Note that backflows from oil products that are used for non-energy</td>
</tr>
</tbody>
</table>
### Flow

<table>
<thead>
<tr>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCOALLIQ</td>
<td>Includes coal, oil and tar sands used to produce synthetic oil.</td>
</tr>
<tr>
<td>TGTL</td>
<td>Includes natural gas used as feedstock for the conversion to liquids, e.g. the quantities of fuel entering the methanol production process for transformation into methanol.</td>
</tr>
<tr>
<td>TBLENDGAS</td>
<td>Includes other gases that are blended with natural gas.</td>
</tr>
<tr>
<td>TCHARCOAL</td>
<td>Includes the transformation of solid biofuels into charcoal.</td>
</tr>
<tr>
<td>TNONSPEC</td>
<td>Includes the transformation of natural gas for hydrogen manufacture and other non-specified transformation.</td>
</tr>
</tbody>
</table>

#### Flows used in the summary balances

- **Liquefaction plants**: LIQUEFAC is equal to the sum of TCOALLIQ and TGTL.
- **Other transformation**: TNONSPEC is equal to the sum of TCHARCOAL and TNONSPEC.

### Energy industry own use and Losses

<table>
<thead>
<tr>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOTENGY</td>
<td>Energy industry own use covers the amount of fuels used by the energy producing industries (e.g. for heating, lighting and operation of all equipment used in the extraction process, for traction and for distribution). It includes energy consumed by energy industries for heating, pumping, traction and lighting purposes [ISIC Rev. 4 Divisions 05, 06, 19 and 35, Group 091 and Classes 0892 and 0721].</td>
</tr>
<tr>
<td>EMINES</td>
<td>Represents the energy which is used directly within the coal industry for hard coal and lignite mining. It excludes coal burned in pithead power stations (included under electricity plants in transformation processes) and free allocations to miners and their families (considered as part of household consumption and therefore included under residential).</td>
</tr>
<tr>
<td>EOILGASEX</td>
<td>Represents the energy which is used for oil and gas extraction. Flared gas is not included.</td>
</tr>
<tr>
<td>EBLASTFUR</td>
<td>Represents the energy which is used in blast furnaces.</td>
</tr>
<tr>
<td>EGASWKS</td>
<td>Represents the energy which is used in gas works.</td>
</tr>
<tr>
<td>EBIOGAS</td>
<td>Represents own consumption of biogas necessary to support temperatures needed for anaerobic fermentation.</td>
</tr>
<tr>
<td>ECOKEOVS</td>
<td>Represents the energy used in coke ovens.</td>
</tr>
<tr>
<td>EPATFUEL</td>
<td>Represents the energy used in patent fuel plants.</td>

</tr>
</tbody>
</table>

**Flow used in the summary balances**

| Energy industry own use | OWNUSE | Is equal to the sum of EMINES, EOILGASEX, EBLASTFUR, EGASWKS, EBIOGAS, ECOKEOVS, EPATFUEL, EBKB, EREFINER, ECOALLIQ, ELNG, EGTL, EPOWERPLT, EPUMPST, ENUC, ECHARCOAL, ENONSPEC. |
## Final consumption

<table>
<thead>
<tr>
<th>Flow</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total final consumption</td>
<td>TFC</td>
<td>Is the sum of the consumption in the end-use sectors and for non-energy use. Energy used for transformation processes and for own use of the energy producing industries is excluded. Final consumption reflects for the most part deliveries to consumers (see note on <code>stock changes</code>). Backflows from the petrochemical industry are not included in final consumption (see <code>from other sources</code> under supply and <code>petrochemical plants</code> in transformation). Note that <code>international aviation bunkers</code> and <code>international marine bunkers</code> are not included in final consumption except for the world total, where they are reported as <code>world aviation bunkers</code> and <code>world marine bunkers in transport</code>.</td>
</tr>
<tr>
<td>Industry</td>
<td>TOTIND</td>
<td>Industry consumption is specified by sub-sector as listed below. Energy used for transport by industry is not included here but is reported under transport. Non-energy use in industry is excluded from industry and reported separately.</td>
</tr>
<tr>
<td>Mining and quarrying</td>
<td>MINING</td>
<td>[ISIC Rev. 4 Divisions 07 and 08 and Group 099] Mining (excluding fuels) and quarrying.</td>
</tr>
<tr>
<td>Construction</td>
<td>CONSTRUC</td>
<td>[ISIC Rev. 4 Divisions 41 to 43]</td>
</tr>
<tr>
<td>Manufacturing</td>
<td>MANUFACT</td>
<td>Manufacturing refers to the sum of the following industrial sub-sectors:   • Iron and steel   • Chemical and petrochemical   • Non-ferrous metals   • Non-metallic minerals   • Transport equipment   • Machinery   • Food and tobacco   • Paper, pulp and print   • Wood and wood products   • Textile and leather   Definitions of the sub-sectors can be found under the listing for each respective sub-sector below.</td>
</tr>
<tr>
<td>Iron and steel</td>
<td>IRONSTL</td>
<td>[ISIC Rev. 4 Group 241 and Class 2431]</td>

<td>WOODPRO</td>
<td>[ISIC Rev. 4 Division 16] Wood and wood products other than pulp and paper.</td>
</tr>
<tr>
<td>Textile and leather</td>
<td>TEXTILES</td>
<td>[ISIC Rev. 4 Divisions 13 to 15]</td>
</tr>
<tr>
<td>Industry not elsewhere</td>
<td>INONSPEC</td>
<td>Including but not limited to: [ISIC Rev. 4 Divisions 22, 31 and 32] Any industry not included above. Note: Most countries have difficulties supplying an industrial breakdown for all fuels. In these cases, the non-specified (industry) row has been used. Regional aggregates of industrial consumption should therefore be used with caution.</td>
</tr>
<tr>
<td>Transport</td>
<td>TOTTRANS</td>
<td>Consumption in transport covers all transport activity (in mobile engines) regardless of the economic sector to which it is contributing (except for military fuel use) [ISIC Rev. 4 Divisions 49 to 51], and is specified below. Non-energy use in transport is excluded from transport and reported separately.</td>
</tr>
<tr>
<td>World aviation bunkers</td>
<td>WORLDAV</td>
<td>Covers fuels delivered to aircraft of all countries that are engaged in international aviation (international aviation bunkers) for the world total. World aviation bunkers is not applicable for individual countries and regions and is included in transport for the world total. Note that for World, total energy supply includes international aviation bunkers.</td>
</tr>
<tr>
<td>Domestic aviation</td>
<td>DOMESAIR</td>
<td>Includes deliveries of aviation fuels to aircraft for domestic aviation - commercial, private, agricultural, etc. It includes use for purposes other than flying, e.g. bench testing of engines, but not airline use of fuel for road transport. The domestic/international split should be determined on the basis of departure and landing locations and not by the nationality of the airline. Note that this may include journeys of considerable length between two airports in a country (e.g. San Francisco to Honolulu). For many countries this incorrectly includes fuel used by domestically owned carriers for outbound international traffic.</td>
</tr>
<tr>
<td>Road</td>
<td>ROAD</td>
<td>Includes fuels used in road vehicles as well as agricultural and industrial highway use. Excludes military consumption as well as motor gasoline used in stationary engines and diesel oil for use in tractors that are not for highway use.</td>
</tr>
<tr>
<td>Rail</td>
<td>RAIL</td>
<td>Includes quantities used in rail traffic, including industrial railways, and in rail transport laid in public roads as part of urban or suburban transport systems (trams, metro, etc.).</td>
</tr>
<tr>
<td>Pipeline transport</td>
<td>PIPELINE</td>
<td>Includes energy used in the support and operation of pipelines transporting gases, liquids, slurries and other commodities, including the energy used for pump stations and maintenance of the pipeline. Energy for the pipeline distribution of natural gas or coal gases, hot water or steam (ISIC Rev. 4 Division 35) from the distributor to final users is excluded and should be reported in energy industry own use, while the energy used for the final distribution of water (ISIC Rev. 4 Division 36) to household, industrial, commercial and other users should be</td>

<td>Population (millions)</td>
<td>POP</td>
<td><strong>For OECD countries:</strong> The main source of these series for 1970 to 2022 is the OECD <em>National Accounts Statistics</em> database [ISSN: 2221-433X (online)], last published in book format as <em>National Accounts of OECD Countries, Volume 2022 Issue 2: Detailed Tables</em>, OECD 2023. Data for 1960 to 1969 have been estimated using the growth rates from the population series published in the OECD Factbook 2015 (online database version). Growth rates from the OECD Factbook 2015 were also used to estimate data for Chile (prior to 1986), Estonia (prior to 1993), Israel (prior to 1995), the Slovak Republic (prior to 1990) and Slovenia (prior to 1995). Data for Colombia (prior to 1985), Latvia (prior to 1995) and Lithuania (prior to 1995) are IEA Secretariat estimates based on GDP growth rates from the World Bank. <strong>For non-OECD countries:</strong> The main source of the population data is <em>World Development Indicators</em>, The World Bank, Washington D.C., 2023. Population data for Cyprus are taken from the Eurostat online database.</td>
</tr>
</tbody>
</table>
| GDP (billion USD, 2015 prices and exchange rates) | GDP | GDP data are derived from three sources:  
- *International Monetary Fund, 2023: World Economic Outlook, October 2023: Navigating Global Divergences*. Washington, DC. (IMF WEO)  
- CEPII – CHELEM database. 2023. (CHELEM)  
Data from IMF WEO are used as a primary source for the period starting in 1980; if not available, data gaps are filled based on the other sources, based on data availability and the hierarchy described below:  
1. Data from IMF WEO  
2. WDI growth rates applied to IMF WEO data  
3. Data from WB WDI for countries not included in IMF WEO for any year  
4. CHELEM growth rates applied to IMF WEO data  
5. Data from CHELEM |

1 Please refer to the section on Geographical coverage.
Data in year $n$ are rebased to 2015 using nominal GDP figures, GDP deflators and market exchange rates using following formula:

$$\text{GDP}_n = \frac{\text{GDP}_{\text{Nominal}}_{n}}{\text{Exchange rate}_{\text{base year}}} \times \frac{\text{Deflator}_{\text{base year}}}{\text{Deflator}_n}$$

Please note that the regional totals shown for OECD and other regions were calculated by summing individual countries’ GDP data. This calculation yields slightly different results to the GDP totals published by primary sources.

International price comparisons based on exchange rates may not reflect the relative purchasing power in each currency. PPPs are the rates of currency conversion that equalize the purchasing power of different currencies by eliminating the differences in price levels between countries. In their simplest form, PPPs are simply price relatives that show the ratio of the prices in national currencies of the same good or service in different countries.

## Product definitions

### Coal

<table>
<thead>
<tr>
<th>Product</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hard coal (if no detail)</td>
<td>HARDCOAL</td>
<td>This item is only used if the detailed breakdown is not available. It includes anthracite, coking coal, other bituminous coal. Hard coal refers to coal of gross calorific value greater than 24 MJ/kg (~5 732 kcal/kg) on an ash-free but moist basis and with a mean random reflectance of vitrinite of at least 0.6. Hard coal may include coals with a GCV greater than or equal to 24 MJ/kg and a mean Rr &lt; 0.6%. Hard coal is the sum of anthracite, coking coal, other bituminous coal and for some countries, prior to 1978, hard coal includes subbituminous coal.</td>
</tr>
<tr>
<td>Brown coal (if no detail)</td>
<td>BROWN</td>
<td>This item is only used if the detailed breakdown is not available. It includes lignite and sub-bituminous coal. Brown coal is the sum of lignite and sub-bituminous coal. For some countries prior to 1978 brown coal excludes sub-bituminous coal.</td>
</tr>
<tr>
<td>Anthracite</td>
<td>ANTCOAL</td>
<td>Anthracite is a high rank coal used for industrial and residential applications. It is generally less than 10% volatile matter and a high carbon content (about 90% fixed carbon). Its gross calorific value is greater than 24 000 kJ/kg on an ash-free but moist basis.</td>
</tr>
<tr>
<td>Coking coal</td>
<td>COKCOAL</td>
<td>Coking coal refers to bituminous coal with a quality that allows the production of a coke suitable to support a blast furnace charge. Its gross calorific value is equal to or greater than 24 000 kJ/kg on an ash-free but moist basis.</td>
</tr>
<tr>
<td>Other bituminous coal</td>
<td>BITCOAL</td>
<td>Other bituminous coal is used mainly for steam raising and space heating purposes and includes all bituminous coal that is not included under coking coal nor anthracite. It is usually more than 10% volatile matter and a relatively high carbon content (less than 90% fixed carbon). Its gross calorific value is greater than 24 000 kJ/kg on an ash-free but moist basis.</td>
</tr>
<tr>
<td>Sub-bituminous coal</td>
<td>SUBCOAL</td>
<td>Sub-bituminous coal includes non-agglomerating coals with a gross calorific value between 20 000 kJ/kg and 24 000 kJ/kg containing more than 31% volatile matter on a dry mineral matter free basis.</td>
</tr>
<tr>
<td>Lignite</td>
<td>LIGNITE</td>
<td>Lignite is a non-agglomerating coal with a gross calorific value of less than 20 000 kJ/kg and greater than 31% volatile matter on a dry mineral matter free basis.</td>
</tr>
<tr>
<td>Patent fuel</td>
<td>PATFUEL</td>
<td>Patent fuel is a composition fuel manufactured from hard coal fines with the addition of a binding agent. The amount of patent fuel produced may, therefore, be slightly higher than the actual amount of coal consumed in the transformation process. Consumption of patent fuels during the patent fuel manufacturing process is included under energy industry own use.</td>
</tr>
<tr>
<td>Coke oven coke</td>
<td>OVENCOKE</td>
<td>Coke oven coke is the solid product obtained from the carbonisation of coal, principally coking coal, at high temperature. It is low in moisture content and volatile matter. Coke oven coke is used mainly in the iron and</td>

</tr>
<tr>
<td>steel industry, acting as energy source and chemical agent. Also included are semi-coke (a solid product obtained from the carbonisation of coal at a low temperature), lignite coke (a semi-coke made from lignite), coke breeze and foundry coke. The heading energy industry own use includes the consumption at the coking plants themselves. Consumption in the iron and steel industry does not include coke converted into blast furnace gas. To obtain the total consumption of coke oven coke in the iron and steel industry, the quantities converted into blast furnace gas have to be added (these are included in blast furnaces).</td>
<td>Gas coke</td>
<td>GASCOKE</td>
</tr>
<tr>
<td>Gas coke is a by-product of hard coal used for the production of town gas in gas works. Gas coke is used for heating purposes. Energy industry own use includes the consumption of gas coke at gas works.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Coal tar is a result of the destructive distillation of bituminous coal or of the low-temperature carbonisation of brown coal. Coal tar is the liquid by-product of the distillation of coal to make coke in the coke oven process. Coal tar can be further distilled into different organic products (e.g. benzene, toluene, naphthalene), which normally would be reported as a feedstock to the petrochemical industry.</td>
<td>Coal tar</td>
<td>COALTAR</td>

<tbody>
<tr>
<td>Oil shale and oil sands</td>
<td>OILSHALE</td>
<td>Oil shale and oil sands are sedimentary rock which contains organic matter in the form of kerogen. Kerogen is a waxy hydrocarbon-rich material regarded as a precursor of petroleum. Oil shale may be burned directly or processed by heating to extract shale oil. Oil shale and tar sands used as inputs for other transformation processes are also included here (this includes the portion consumed in the transformation process). Shale oil and other products derived from liquefaction are included in from other sources under crude oil (other hydrocarbons).</td>
</tr>
</tbody>
</table>

### Natural gas

<table>
<thead>
<tr>
<th>Product</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Natural gas</td>
<td>NATGAS</td>
<td>Natural gas comprises gases, occurring in underground deposits, whether liquified or gaseous, consisting mainly of methane. It includes &quot;non-associated&quot; gas originating from fields producing hydrocarbons only in gaseous form; &quot;associated&quot; gas produced in association with crude oil; and methane recovered from coal mines (colliery gas) or from coal seams (coal seam gas). Production represents dry marketable production within national boundaries, including offshore production and is measured after purification and extraction of NGL and sulphur. It includes quantities used within the natural gas industry; in gas extraction, pipeline systems and processing plants. Quantities of gas that are re-injected, vented or flared are excluded.</td>
</tr>
</tbody>
</table>
## Crude, NGL, refinery feedstocks

<table>
<thead>
<tr>
<th>Product</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crude/NGL/feedstocks (if no detail)</td>
<td>CRNGFEED</td>
<td>This item is only used if the detailed breakdown is not available. It includes crude oil, natural gas liquids, refinery feedstocks, additives/blending components and other hydrocarbons.</td>
</tr>
<tr>
<td>Crude oil</td>
<td>CRUDEOIL</td>
<td>Crude oil is a mineral oil consisting of a mixture of hydrocarbons of natural origin and associated impurities, such as sulphur. It exists in the liquid phase under normal surface temperatures and pressure and its physical characteristics (density, viscosity, etc.) are highly variable. It includes field or lease condensates (separator liquids) which are recovered from associated and non-associated gas where it is commingled with the commercial crude oil stream.</td>
</tr>
<tr>
<td>Natural gas liquids</td>
<td>NGL</td>
<td>NGL are the liquid or liquefied hydrocarbons recovered from natural gas in separation facilities or gas processing plants. Natural gas liquids include ethane, propane, butane (normal and iso-), (iso) pentane and pentanes plus (sometimes referred to as natural gasoline or plant condensate).</td>
</tr>
<tr>
<td>Refinery feedstocks</td>
<td>REFFFEEDS</td>
<td>A refinery feedstock is a processed oil destined for further processing (e.g. straight run fuel oil or vacuum gas oil) other than blending in the refining industry. It is transformed into one or more components and/or finished products. With further processing, it will be transformed into one or more components and/or finished products. This definition also covers returns from the petrochemical industry to the refining industry (e.g. pyrolysis gasoline, C4 fractions, gasoil and fuel oil fractions)</td>
</tr>
<tr>
<td>Additives/blending components</td>
<td>ADDITIVE</td>
<td>Additives are non-hydrocarbon substances added to or blended with a product to modify its properties, for example, to improve its combustion characteristics. Alcohols and ethers (MTBE, methyl tertiary-butyl ether) and chemical alloys such as tetraethyl lead are included here. The biomass fractions of biogasoline, biodiesel and ethanol are not included here, but under liquid biofuels. This differs from the presentation of additives in the Oil Information publication.</td>
</tr>
<tr>
<td>Other hydrocarbons</td>
<td>NONCRUDE</td>
<td>This category includes synthetic crude oil from tar sands, shale oil, etc., liquids from coal liquefaction, output of liquids from natural gas conversion into gasoline, hydrogen and emulsified oils (e.g. Orimulsion).</td>
</tr>
</tbody>
</table>
### Oil products

<table>
<thead>
<tr>
<th>Product</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refinery gas</td>
<td>REFINGAS</td>
<td>Refinery gas is defined as non-condensable gas obtained during distillation of crude oil or treatment of oil products (e.g. cracking) in refineries. It consists mainly of hydrogen, methane, ethane and olefins. It also includes gases which are returned from the petrochemical industry. Refinery gas production refers to gross production. Own consumption is shown separately under oil refineries in energy industry own use.</td>
</tr>
<tr>
<td>Ethane</td>
<td>ETHANE</td>
<td>Ethane is a naturally gaseous straight-chain hydrocarbon (C₂H₆). It is a colourless paraffinic gas which is extracted from natural gas and refinery gas streams.</td>
</tr>
<tr>
<td>Liquefied petroleum gases (LPG)</td>
<td>LPG</td>
<td>Liquefied petroleum gases are the light hydrocarbon fraction of the paraffin series, derived from refinery processes, crude oil stabilisation plants and natural gas processing plants, comprising propane (C₃H₈) and butane (C₄H₁₀) or a combination of the two. They could also include propylene, butylene, isobutene and isobutylene. LPGs are normally liquefied under pressure for transportation and storage.</td>
</tr>
<tr>
<td>Motor gasoline excl. biofuels</td>
<td>NONBIOGASO</td>
<td>Motor gasoline is light hydrocarbon oil for use in internal combustion engines such as motor vehicles, excluding aircraft. Motor gasoline is distilled between 35°C and 215°C and is used as a fuel for land based spark ignition engines. Motor gasoline may include additives, oxygenates and octane enhancers, including lead compounds such as TEL (tetraethyl lead) and TML (tetramethyl lead). Motor gasoline excluding biofuels does not include the liquid biofuel or ethanol blended with gasoline - see liquid biofuels.</td>
</tr>
<tr>
<td>Aviation gasoline</td>
<td>AVGAS</td>
<td>Aviation gasoline is motor spirit prepared especially for aviation piston engines, with an octane number suited to the engine, a freezing point of -60°C, and a distillation range usually within the limits of 30°C and 180°C.</td>
</tr>
<tr>
<td>Gasoline type jet fuel</td>
<td>JETGAS</td>
<td>Gasoline type jet fuel includes all light hydrocarbon oils for use in aviation turbine power units, which distil between 100°C and 250°C. This fuel is obtained by blending kerosenes and gasoline or naphthas in such a way that the aromatic content does not exceed 25% in volume, and the vapour pressure is between 13.7 kPa and 20.6 kPa. Additives can be included to improve fuel stability and combustibility.</td>
</tr>
<tr>
<td>Kerosene type jet fuel excl. biofuels</td>
<td>NONBIOJETK</td>
<td>Kerosene type jet fuel is a medium distillate used for aviation turbine power units. It has the same distillation characteristics and flash point as kerosene (between 150°C and 300°C but not generally above 250°C). In addition, it has particular specifications (such as freezing point) which are established by the International Air Transport Association (IATA). It includes kerosene blending components. Kerosene type jet fuel excluding biofuels does not include the liquid biofuels blended with jet kerosene.</td>
</tr>
<tr>
<td>Other kerosene</td>
<td>OTHKERO</td>
<td>Kerosene (other than kerosene used for aircraft transport which is included with aviation fuels) comprises refined petroleum distillate intermediate in volatility between gasoline and gas/diesel oil. It is a medium oil distilling between 150°C and 300°C.</td>
</tr>
<tr>
<td>Product</td>
<td>Short name</td>
<td>Definition</td>
</tr>
<tr>
<td>---------</td>
<td>------------</td>
<td>------------</td>
</tr>
<tr>
<td>Gas/diesel oil excl. biofuels</td>
<td>NONBODIES</td>
<td>Gas/diesel oil includes heavy gas oils. Gas oils are obtained from the lowest fraction from atmospheric distillation of crude oil, while heavy gas oils are obtained by vacuum redistillation of the residual from atmospheric distillation. Gas/diesel oil distils between 180°C and 380°C. Several grades are available depending on uses: diesel oil for diesel compression ignition (cars, trucks, marine, etc.), light heating oil for industrial and commercial uses, and other gas oil including heavy gas oils which distil between 380°C and 540°C and which are used as petrochemical feedstocks. Gas/diesel oil excluding biofuels does not include the liquid biofuels blended with gas/diesel oil – see liquid biofuels.</td>
</tr>
<tr>
<td>Fuel oil</td>
<td>RESFUEL</td>
<td>Fuel oil defines oils that make up the distillation residue. It comprises all residual fuel oils, including those obtained by blending. Its kinematic viscosity is above 10 cSt at 80°C. The flash point is always above 50°C and the density is always higher than 0.90 kg/l.</td>
</tr>
<tr>
<td>Naphtha</td>
<td>NAPHTHA</td>
<td>Naphtha is a feedstock destined either for the petrochemical industry (e.g. ethylene manufacture or aromatics production) or for gasoline production by reforming or isomerisation within the refinery. Naphtha comprises material that distils between 30°C and 210°C. Naphtha imported for blending is shown as an import of naphtha, and then shown in the transfers row as a negative entry for naphtha and a positive entry for the corresponding finished product (e.g. gasoline).</td>
</tr>
<tr>
<td>White spirit &amp; industrial spirit (SBP)</td>
<td>WHITESP</td>
<td>White spirit and industrial spirit (SBP) are refined distillate intermediates with a distillation in the naphtha/kerosene range. White spirit has a flash point above 30°C and a distillation range of 135°C to 200°C. Industrial Spirit (SBP) comprises light oils distilling between 30°C and 200°C, with a temperature difference between 5% volume and 90% volume distillation points, including losses, of not more than 60°C. In other words, SBP is a light oil of narrower cut than motor spirit. There are seven or eight grades of industrial spirit, depending on the position of the cut in the distillation range defined above.</td>
</tr>
<tr>
<td>Lubricants</td>
<td>LUBRIC</td>
<td>Lubricants are hydrocarbons produced from distillate or residue; they are mainly used to reduce friction between bearing surfaces. This category includes all finished grades of lubricating oil, from spindle oil to cylinder oil, and those used in greases, including motor oils and all grades of lubricating oil base stocks.</td>
</tr>
<tr>
<td>Bitumen</td>
<td>BITUMEN</td>
<td>Bitumen is a solid, semi-solid or viscous hydrocarbon with a colloidal structure that is brown to black in colour. It is obtained by vacuum distillation of oil residues from atmospheric distillation of crude oil. Bitumen is often referred to as asphalt and is primarily used for surfacing of roads and for roofing material. This category includes fluidised and cut back bitumen.</td>
</tr>
<tr>
<td>Paraffin waxes</td>
<td>PARWAX</td>
<td>Paraffin waxes are saturated aliphatic hydrocarbons. These waxes are residues extracted when dewaxing lubricant oils, and they have a crystalline structure which is more or less fine according to the grade. Their main characteristics are that they are colourless, odourless and translucent, with a melting point above 45°C.</td>
</tr>
</tbody>
</table>
### Petroleum coke

**PETCOKE**

Petroleum coke is defined as a black solid residue, obtained mainly by cracking and carbonising of petroleum derived feedstocks, vacuum bottoms, tar and pitches in processes such as delayed coking or fluid coking. It consists mainly of carbon (90 to 95%) and has a low ash content. It is used as a feedstock in coke ovens for the steel industry, for heating purposes, for electrode manufacture and for production of chemicals. The two most important qualities are "green coke" and "calcined coke". This category also includes "catalyst coke" deposited on the catalyst during refining processes: this coke is not recoverable and is usually burned as refinery fuel.

### Other oil products

**ONONSPEC**

Other oil products not classified above (e.g. tar, sulphur and grease) are included here. This category also includes aromatics (e.g. BTX or benzene, toluene and xylene) and olefins (e.g. propylene) produced within refineries.

### Biofuels and Waste

<table>
<thead>
<tr>
<th>Product</th>
<th>Short name</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Industrial waste</td>
<td>INDWASTE</td>
<td>Industrial waste of non-renewable origin consists of solid and liquid products (e.g. tyres) combusted directly, usually in specialised plants, to produce heat and/or power. Renewable industrial waste is not included here, but with solid biofuels, biogases or liquid biofuels.</td>
</tr>
<tr>
<td>Municipal waste (renewable)</td>
<td>MUNWASTER</td>
<td>Municipal waste consists of products that are combusted directly to produce heat and/or power and comprises wastes produced by households, industry, hospitals and the tertiary sector that are collected by local authorities for incineration at specific installations. Municipal waste is split into renewable and non-renewable.</td>
</tr>
<tr>
<td>Municipal waste (non-renewable)</td>
<td>MUNWASTEN</td>
<td>Municipal waste consists of products that are combusted directly to produce heat and/or power and comprises wastes produced by households, industry, hospitals and the tertiary sector that are collected by local authorities for incineration at specific installations. Municipal waste is split into renewable and non-renewable.</td>
</tr>
<tr>
<td>Primary solid biofuels</td>
<td>PRIMSBIO</td>
<td>Primary solid biofuels is defined as any plant matter used directly as fuel or converted into other forms before combustion. This covers a multitude of woody materials generated by industrial process or provided directly by forestry and agriculture (firewood, wood chips, bark, sawdust, shavings, chips, sulphite lyes also known as black liquor, animal materials/wastes and other solid biofuels). Note that for biofuels, only the amounts of biomass specifically used for energy purposes (a small part of the total) are included in the energy statistics. Therefore, the non-energy use of biomass is not taken into consideration and the quantities are null by definition.</td>
</tr>
<tr>
<td>Biogases</td>
<td>BIOGASES</td>
<td>Biogases are gases arising from the anaerobic fermentation of biomass and the gasification of solid biomass (including biomass in wastes). The biogases from anaerobic fermentation are composed principally of methane and carbon dioxide and comprise landfill gas, sewage sludge gas and other biogases from anaerobic fermentation. Biogases can also be produced from thermal processes (by gasification or pyrolysis) of biomass and are mixtures containing hydrogen and carbon monoxide (usually known as syngas) along with other components. These gases may be further processed to...</td>
</tr>
</tbody>
</table>
modify their composition and can be further processed to produce substitute natural gas. Biogases are used mainly as a fuel but can be used as a chemical feedstock.

Biogasoline includes bioethanol (ethanol produced from biomass and/or the biodegradable fraction of waste), biomethanol (methanol produced from biomass and/or the biodegradable fraction of waste), bioETBE (ethyl-tertio-butyl-ether produced on the basis of bioethanol, the percentage by volume of bioETBE that is calculated as biofuel is 47%) and bioMTBE (methyl-tertio-butyl-ether produced on the basis of biomethanol: the percentage by volume of bioMTBE that is calculated as biofuel is 36%). Biogasoline includes the amounts that are blended into the gasoline - it does not include the total volume of gasoline into which the biogasoline is blended.

Biodiesels includes biodiesel (a methyl-ester produced from vegetable or animal oil, of diesel quality), biodimethylether (dimethylether produced from biomass), Fischer Tropsch (Fischer Tropsch produced from biomass), cold pressed bio-oil (oil produced from oil seed through mechanical processing only) and all other liquid biofuels which are added to, blended with or used straight as transport diesel. Biodiesels includes the amounts that are blended into the diesel - it does not include the total volume of diesel into which the biodiesel is blended.

Liquid biofuels derived from biomass and blended with or replacing jet kerosene.

Other liquid biofuels include liquid biofuels not reported in either biogasoline or biodiesels.

This item is used when the detailed breakdown for primary biofuels and waste is not available.

It covers the solid residue of the destructive distillation and pyrolysis of wood and other vegetal material.

Is equal to the direct sum of HYDRO, GEOTHERM, SOLARPV, SOLARTH, TIDE, WIND, MUNWASTER, PRIMSBIO, BIOGASES, BIOGASOL, BIODIESEL, OBIOLIQ, RENEWNS and CHARCOAL. Note that it does not include any estimation of the amount of electricity and heat derived from renewable sources.

Electricity and Heat

This item is only used if the detailed breakdown is not available. It includes coke oven gas, blast furnace gas and other recovered gases. Gas works gas is not included here.

This item is only used if the detailed breakdown is not available.

<tbody>
<tr>
<td>Nuclear</td>
<td>NUCLEAR</td>
<td>Energy released by nuclear fission or nuclear fusion.</td>
</tr>
<tr>
<td>Hydro</td>
<td>HYDRO</td>
<td>Hydro energy represents the potential and kinetic energy of water converted into electricity in hydroelectric plants.</td>
</tr>
</tbody>
</table>
| Geothermal                  | GEOTHERM   | Geothermal energy is the energy available as heat emitted from within the earth's crust, usually in the form of hot water or steam. It is exploited at suitable sites:  
  - for electricity generation using dry stream or high enthalpy brine after flashing  
  - directly as heat for district heating, agriculture, etc. |
| Solar photovoltaics         | SOLARPV    | Electricity from photovoltaic cells.                                        |
| Solar thermal               | SOLARTH    | Solar energy is the solar radiation exploited for hot water production and electricity generation, by:  
  - flat plate collectors, mainly of the thermosyphon type, for domestic hot water or for the seasonal heating of swimming pools  
  - solar thermal-electric plants  
  Passive solar energy for the direct heating, cooling and lighting of dwellings or other buildings is not included. |
| Tide, wave and ocean        | TIDE       | Tide, wave and ocean represents the mechanical energy derived from tidal movement, wave motion or ocean current and exploited for electricity generation. |
| Wind                        | WIND       | Wind energy represents the kinetic energy of wind exploited for electricity generation in wind turbines. |
| Other sources               | OTHER      | Other sources includes production not included elsewhere such as fuel cells. |
| Electricity                 | ELECTR     | Gross electricity production is measured at the terminals of all alternator sets in a station; it therefore includes the energy taken by station auxiliaries and losses in transformers that are considered integral parts of the station.  
  The difference between gross and net production is generally estimated as 7% for conventional thermal stations, 1% for hydro stations, and 6% for nuclear, geothermal and solar stations.  
  Production in hydro stations includes production from pumped storage plants. |
| Heat                        | HEAT       | Heat production includes all heat produced by main activity producer CHP and heat plants, as well as heat sold by autoproducer CHP and heat plants to third parties.  
  Fuels used to produce quantities of heat for sale are included in the transformation processes under the rows CHP plants and Heat plants. The use of fuels for heat which is not sold is included under the sectors in which the fuel use occurs. Data on heat have become available in different years for different countries and thus any aggregated data should be used with caution. |

**Memo: IEA and Accession/Association countries**

IEAFAMILY Includes: IEA member countries: Australia, Austria, Belgium, Canada, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Japan, Korea, Lithuania; Luxembourg, Mexico, the Netherlands, New Zealand, Norway, Poland, Portugal, the Slovak Republic, Spain, Sweden, Switzerland, the Republic of Türkiye, the United Kingdom and the United States; Accession countries: Chile, Colombia, Costa Rica, Israel and Latvia; Association countries: Argentina, Brazil, the People’s Republic of China, Egypt, India, Indonesia, Kenya, Morocco, Senegal, Singapore, South Africa, Thailand, and Ukraine.

**Memo: European Union - 27**

EU27_2020 Includes Austria; Belgium; Bulgaria; Croatia; Cyprus3; the Czech Republic; Denmark; Estonia; Finland; France; Germany; Greece; Hungary; Ireland; Italy; Latvia; Lithuania; Luxembourg; Malta; the Netherlands; Poland; Portugal; Romania; the Slovak Republic; Slovenia; Spain and Sweden. Please note that in the interest of having comparable data, all these countries are included since 1990 despite different entry dates into the European Union.

**Memo: European Union - 28**

EU28 Refers to the EU27 with the addition of the United Kingdom. Includes Austria; Belgium; Bulgaria; Croatia; Cyprus; the Czech Republic; Denmark; Estonia; Finland; France; Germany; Greece; Hungary; Ireland; Italy; Latvia; Lithuania; Luxembourg; Malta; the Netherlands; Poland; Portugal; Romania; the Slovak Republic; Slovenia; Spain; Sweden and the United Kingdom4. Please note that in the interest of having comparable data, all these countries are included since 1990 despite different entry dates into the European Union.

**Memo: G7**

MG7 Includes Canada, France, Germany, Italy, Japan, United Kingdom and United States.

---

3 Refer to the country note for Cyprus earlier in this section.
4 As of the 1st of February 2020, the United Kingdom (UK) is no longer part of the European Union (EU) and has entered into a transition period until 31 December 2020.
### Fiscal year

This table lists the countries for which data are reported on a fiscal year basis. More information on beginning and end of fiscal years by country is reported in the column ‘Definition’.

This document is without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area. In this publication, ‘country’ refers to country, economy or territory, as case may be. Data start in 1960 for OECD countries, and in 1971 for non-OECD countries and regional aggregates, unless otherwise specified.

Country notes and sources

OECD countries

General notes

The notes given in this document refer to data for the years 1960 to 2022 published in the on-line data service. In general, more detailed notes are available for data starting in 1990.

Data are obtained through annual submission of five fuel questionnaires from national administrations, as indicated for each country in the section on sources.

In some instances it has been necessary for the IEA Secretariat to estimate some data; explanations of the estimates are provided in the country notes. For more information on fuel-specific methodologies, please refer to the IEA information publications (Oil information, Natural Gas information, Coal information, Electricity information and Renewables information).

This section lists a few specific notes that apply to all countries, and it is followed by a time series of comprehensive country-specific notes by fuel and flow.

Prior to 1974, most fuel inputs and electricity and heat outputs for autoproducers are included in main activity producers. The figures for the quantities of fuels used for the generation of electricity and heat and the corresponding outputs in CHP and heat plants should be used with caution. Despite estimates introduced by the IEA Secretariat, inputs and outputs are not always consistent. Please refer to notes below under Electricity and heat.

Data for anthracite, coking coal, other bituminous coal, sub-bituminous coal and lignite are available separately from 1978. Prior to 1978, only data for hard coal and brown coal (lignite/sub-bituminous coal) are available.

In 1996, the IEA Secretariat extensively revised data on coal and coke use in blast furnaces, and in the iron and steel industry (for those countries with blast furnaces), based on data provided to the OECD Steel Committee and other sources. The quantities of fuels transformed into blast furnace gas have been estimated by the IEA Secretariat based on its blast furnace model.
For biofuels and waste (i.e. solid biofuels, biogases, liquid biofuels, industrial waste and municipal waste), there may be breaks in time series between 1988 and 1989, as in 1997 the IEA Secretariat extensively revised these data based on data from Eurostat (for the EU-15 member countries) and on other national sources for other OECD member countries, and data from Eurostat were generally available from 1989. Generally, data on biofuels and waste are reported in non-specified prior to 1989.
Australia

Source

Department of Climate Change, Energy, the Environment and Water, Canberra.

General notes

All data refer to the fiscal year (e.g. July 2021 to June 2022 for 2022).

Starting with the 2013 edition and following, data for Australia were revised back to 2003 due to the adoption of the National Greenhouse and Energy Reporting (NGER) as the main energy consumption data source for the Australian Energy Statistics. As a result, there are breaks in the time series for many data between 2002 and 2003. The revisions have also introduced some methodological issues, including identifying inputs and outputs to certain transformation processes such as gas works plants, electricity plants and CHP plants. Energy industry own use and inputs to the transformation processes are sometimes not reported separately in the correct categories. More detail is given in the notes below.

Coal

General notes

Stock change and statistical difference are both subject to further review for black coal grade by the Australian administration.

Due to confidentiality reasons, for other bituminous coal, subbituminous coal, lignite and coal tar the Australian administration submits subtotals of demand flows but not their breakdown. As a result, since the 2020 edition, part of the demand side data for these products have been estimated by the IEA Secretariat for the years from 2018 onwards.

From the 2020 edition, part of the demand side for anthracite is confidential. Some of the quantities reported under “Industry, not elsewhere specified” could refer to other flows.

In the 2021 edition, the split between underground and surface production of coking coal and other bituminous coal was revised back to 2015 based on new available data.

In the 2017 edition, the Australian administration revised data on coal tar back to 2010 resulting in breaks in time series between 2009 and 2010.
In the 2016 edition, extensive revisions were made to 2010 to 2013 data for many primary and manufactured products causing breaks in production, trade and consumption between 2009 and 2010. Time series which begin in 2010 may be reported in other flows until 2009. 2014 data were reported on the same basis as 2010 to 2013.

In the 2015 edition, increases of production and consumption of **other bituminous coal** for 2013 are due to both new mine capacity and improved classification data. In the 2016 edition, these revisions were extended back to 2010. Apparent switching between **sub-bituminous coal** and **other bituminous coal** between 2009 and 2010 suggests that some **other bituminous coal** was reported as **sub-bituminous coal** prior to this, across several flows.

Reclassification of some **coal** types in the 2013 edition were calculated on an energy basis and resulted in a net increase of quantities of primary coal from 2003 to 2011.

Breaks in the time series for **gas works gas** between 2008 and 2009 are due to a change of survey, while reduced production and consumption between 2006 and 2008 are due to the removal of some **natural gas** inputs.

Data on **blast furnace gas** for electricity production by autoproducers begins in 1986.

**Hard coal** data prior to 1978 may include **sub-bituminous coal**.

**Supply**

In the 2024 edition, large stock change in **coking** and **other** bituminous coal reflects significant drawdown of stocks for 2022.

In the 2023 edition, **other bituminous coal** and **coking coal** production for 2017 and 2018 were revised due to updated commodities statistics. As a result, also stock change figures have been realigned from 2017 onwards due to new available information.

In 2018, a substantial stock draw of **coking coal** followed a 2017 stock build caused by meteorological phenomena.

The decrease of **lignite** production and consumption in 2017 and 2018 was due to the closure of brown coal fired Hazelwood power plant in early 2017, contributing to a higher consumption of **other bituminous coal**.
Only anthracite trade is reported separately; the remainder that is consumed domestically is included with other bituminous coal due to confidentiality requirements. There were no recorded anthracite exports or estimated anthracite production in 2018.

Anthracite production data are unavailable and are therefore estimated by the Australian administration as a balance of trade and consumption. There is no visibility over stock movements of this fuel.

Registers show large sporadic shipments of anthracite rather than steady supply streams.

Export trade in coke oven coke between 2005 and 2011 exists, but data are unavailable for reasons of confidentiality. From 2012 onward exports are estimated by the Australian administration but without providing information on the destination country.

Transformation

In the 2023 edition, the consumption of other bituminous coal in main activity producer electricity plants has been revised from 2017 onwards in line with administrative reporting.

In 2015, a new plant within the mining sector started its operations increasing the consumption of coke oven coke.

The one company producing BKB closed its operation during 2015. As such, production and consumption declined significantly.

For 2003 to 2012, coke oven gas reported as energy industry own-use in electricity or CHP plants is used for generation purposes, while natural gas used for own-use plant support is reported in the transformation sector.

Natural gas consumed to fuel the distribution of natural gas in natural gas networks is reported as transformation for gas works gas production until 2005.

The drop in BKB production in 2004 was due to a fire in the main production plant.

Consumption

Decline in coking coal use alongside rising steel production appears commensurate with process changes in Iron and Steel sector.

In the 2016 edition, revisions for 2010 onwards have increased the quantities of sub-bituminous coal and decreased the quantities of other bituminous coal.
being used in the non-metallic minerals industry as more accurate information has become available.

Consumption in wood and wood products is included in paper, pulp and print from 2001 onwards.

Oil

General notes

In the 2023 edition, the Australian administration introduced revisions for some consumption series back to 2009 due to improved estimates in line with NGER data. This may result in breaks between 2009 and 2010.

In the 2022 edition, the Australian administration introduced further revisions due to a change in reporting methods, which included mandatory reporting obligation for refineries and companies in the oil sector, resulting in a break in series between 2016 and 2017.

From the 2022 edition onwards, data for white spirit, naphtha and bitumen (except for trade data for the latter) are included in other oil products due to confidentiality from 2019 onwards. Refinery outputs for aviation gasoline are confidential and included in other oil products starting from 2020 data.

In the 2024 edition (i.e. starting from 2022 data), data for petroleum coke are confidential and included in other oil products too. Finally, 2022 data for refinery feedstocks (except for product transfers) are also confidential.

There are breaks in series between 2017 and 2018 due to a change in reporting methods, which includes new mandatory reporting for refineries and companies in the oil sector.

Moreover, in the 2019 edition the Australian administration introduced several revisions to the time series back to 2011 as a result of new and updated data sources becoming available.

In 2017, the Australian administration added new companies to their reporting. This primarily impacts the stocks of motor gasoline and gas/diesel oil.

Between 2009 and 2010 some breaks in time series may occur due to changes in methodologies and to improved data sources, with major revisions explained below.
Other hydrocarbons reported under from other sources natural gas correspond to hydrogen used in refineries from 2011 to 2016, also represented as the output of non-specified transformation in the balances format.

An in-depth review of Australian oil statistics, in particular investigation of amounts currently reported under recycled products as well as statistical differences for motor gasoline and bitumen, is on-going and may result in further improvements in the next editions.

Supply
The declines in refinery output and exports of refined products in 2021 are the result of refinery closures.

In the 2022, 2023 and 2024 editions, refinery fuel use of fuel oil in 2020, 2021 and 2022 are confidential.

In the 2023 and 2024 editions, refinery fuel use of other oil products in 2021 and 2022 includes fuel oil and unclassified fuels.

In the 2022 and 2023 editions, stock changes are confidential for other kerosene (2020 and 2021) and gas/diesel oil (partially for 2020 and 2021). Where appropriate, these are included in other oil products. Stock breaks may therefore appear.

Part of LPG exports in 2019 is confidential.

In 2019, refinery output of other oil products increased as a result of higher consumption in oil and gas extraction and improved data collection.

In 2018, production of NGL declined as a result of product reclassification where quantities of condensate had previously been included and now moved to crude oil.

Crude oil production and imports continued to decline in 2016 following the closure of domestic refining capacity in New South Wales (Kurnell Refinery) and Queensland (Bulwer Island Refinery). Refinery outputs also fell as a result. These two sites have been converted to import terminals helping Australia expanding its import capacity. As a result refined products imports increased considerably in 2016.

From 2010 crude oil production estimates for selected companies have been replaced by actual data.

Imports of fuel oil have been estimated by the Australian administration.
In the 2015 data, fuel oil imports dropped significantly due to the closure of the two large consumers of this product, the Gove alumina refinery and the Point Henry aluminium smelter.

There is a break in the time series for crude oil and NGL between 2001 and 2002. The drop in the production of crude oil in 1999 is due to a gas explosion at the Longford plant.

Prior to 1992, part of the NGL production is included in crude oil.

Transformation
There is a break in the refinery balance between 2010 and 2011 due to the reclassification of a facility from upstream to downstream.

As a result of a new methodology adopted to split gas/diesel oil inputs between main activity and autoproducer plants, breaks in series appear between 2009 and 2010.

Consumption
In the 2022 edition, due to improved data and mandatory reporting, the Australian administration introduced revisions from 2016 onwards for LPG, motor gasoline, gas/diesel oil, kerosene type jet fuel, fuel oil, lubricants and other oil products.

In the 2021 edition, due to a change in the reporting methods, the Australian administration has reallocated some consumption of LPG, other kerosene, fuel oil and other oil products from the commercial and public services sector to not elsewhere specified (energy) for 2018 data onwards.

In the 2021 edition, consumption of LPG, gas/diesel oil and other oil products in oil and gas extraction increased owing to new facilities going online in 2019.

In the 2021 edition, non-energy use of white spirit and bitumen in not elsewhere specified (industry) are included in other oil products due to confidentiality.

In the 2021 edition, there is a break between 2018 and 2019 in the transport sector consumption notably for LPG, gas/diesel oil, kerosene type jet fuel and fuel oil. The Australian administration intends to submit historical revisions in the 2022 edition.

In 2018 fuel oil consumption in the commercial and public services sector increased due to the inclusion of data for a new water and waste services facility.
In 2017 the Queensland Nickel refinery closed down and the Portland Aluminium refinery was reduced for an extended period due to a power fault. As a result fuel oil consumption in the non-ferrous metal sector declined in 2017.

In the 2019 edition the bitumen time series was revised with higher levels of consumption for 2015 and 2016. This is based on the monthly Australian Petroleum Statistics which now has better coverage of the consumption data.

Breaks in the time series appear between 2009 and 2010 in transport consumption due to a change in methodology.

Natural gas

General notes
In the 2020 edition, the Australian administration reallocated quantities in the consumption side, based on analysis of new data and to be consistent with Australian Energy Statistics. Additionally, revisions were made to trade flows based on a revised methodology for calculating the volumes of imports and exports.

In the 2019 edition, the Australian administration proceeded to major revisions on the supply side from 2013 onwards due to a change in methodology on production quantities and more recent sources on calorific values. Additionally the Oil and gas extraction, and Liquefaction (LNG)/regasification plants on the demand side were revised from 2003 onwards, which resulted in increased statistical differences.

In the 2016 edition, the Australian administration revised natural gas demand data for some flows back to 2010, resulting in breaks in time series between 2009 and 2010.

In 2015, the Australian administration revised production and certain consumption data back to 2006. The production figures now include previously uncaptured flows.

Prior to 1991 natural gas data include ethane.

Supply
In the 2023 edition, Opening/Closing stock level and Stock changes are reported for the first time with data available back to 2002. In the 2022 edition, historical
revisions were made to *gas vented* and *gas flared* back to 1990 due to new methodology.

The GCV of *inland consumption (calculated)* has been falling since 2017 due to increases in liquefaction and the volume lost during this process.

For 2018, there is a continuation of the increase in *indigenous production* (+15%) and *exports* (+18%) of gas, which started in 2017 due to the LNG exporting capacity coming online in 2016 and 2017.

Around 30% of the production (mainly coal seam gas) is estimated by the Australian administration.

**Transformation**

From 2011 to 2016, the *Non-specified transformation* of *natural gas* represents amounts used to produce hydrogen for hydrodesulphurization in refineries.

Until 2005, natural gas consumed to fuel the distribution of natural gas in natural gas networks was reported as transformation for gas works gas production.

**Consumption**

There is a break in the time series between 2021 and 2022 in the *Transport Sector* due to a change in estimation methodology. Consumption in the *residential* and *agriculture/forestry sectors* is estimated by the Australian administration based on models.

There are breaks between 2002 and 2003 in due to major revisions made in the *Oil and gas extraction*, and *Liquefaction (LNG)/regasification plants* in the context of the 2019 edition.

Between 2009 and 2010 some breaks in time series may occur due to changes in methodologies and to improved data sources. Revisions to the consumption data include changes to energy use in liquefaction plants, and a shift of *gas works gas (transformation)* to *non-specified energy* from 2006 onwards. Revisions to previous years are pending.

Between 2001 and 2002 there are breaks in time series for consumption data due to an industry structural shift and changes in methodology.

Data for 1999 and 2000 end-use consumption are estimated by the Australian administration.
Biofuels and waste

General notes
In the 2018 edition, biogases were revised downward by the Australian administration back to 2015 as a result of the removal on 1 July 2015 of a production subsidy for domestic ethanol. The subsidy was equal to the excise rate on unleaded petrol.

A large biogas production facility did not report any production in 2016-2017. In 2017, this led to reductions in the consumption of biogases in auto CHP plants and the commercial and public services sector.

Increases in production of solid biofuels since 2014 are related to incentives under the Renewable Energy Target legislation, which went into effect in 2001 and aims to increase the share of electricity generation from renewable sources. More information is available here: http://www.cleanenergyregulator.gov.au/RET.

The data for biogasoline and biodiesel are not available before 2003 and 2004 respectively.

From 1996, a different industry consumption breakdown for biofuels and waste is available and leads to breaks in time series.

Supply

Biogas production data at sewage treatment works are not available.

Indigenous production of biodiesel has decreased substantially starting with 2016 data because one of the major biodiesel producers ceased production in January 2016. The trend continues in 2017, when, according to Bioenergy Australia, low oil prices and higher feedstock prices created a difficult market for the remaining biodiesel producers. The trend continues in 2018 data.

Production of biogasoline (ethanol) decreased since the Ethanol Production Grants Programme ended on 30 June 2015. On 1 July 2015, the fuel excise on domestically produced ethanol was reduced to zero and will be increased by 2.5 cents per litre until it reaches 12.5 cents per litre. Additionally, 2017 quantities were also affected by low oil prices.

Consumption

In the 2018 edition, solid biofuels were revised back to 2010 by the Australian administration, expanding the scope from the revisions in the 2016 and 2017
editions to *indigenous production* and consumption sectors which weren’t previously revised. This results in a break in time series between 2009 and 2010.

In the 2017 edition of this publication, there has been a revision to the time series of *solid biofuels* consumption in “Paper, pulp and printing” sector. This time series has been revised back to 2010 resulting in break in time series between 2009 and 2010.

In the 2016 edition of this publication, the Australian administration revised *primary solid biofuels* back to 2010 which impact mostly final consumption in *food and tobacco*. This created breaks in time series.

The consumption data of *biogases* in industry is not available before 2003.

**Electricity and heat**

**General notes**

Calculated calorific values of combustible fuels are reported in gross values by Australia due to the lack on determining the moisture content of the fuels.

In the 2016 edition, several *combustible fuel* electricity production time series as well as some *electricity* consumption time series were revised by the Australian administration back to 2010 in order to limit the use of estimated data and are causing some breaks.

From 1992 onwards, *heat* data are not available as there is insufficient data to report what little heat is sold in Australia.

**Supply**

Data for production of electricity from *wind* are available from 1994.

Data for electricity production from solar photovoltaic start in 1992 and from solar thermal in 2003.

**Transformation**

For 2018 data, electricity output from *lignite* declined due to the closure of the Hazelwood power plant. In addition, there was no output from *BKB* due to the closure of both Hazelwood power plant, and the only briquette manufacturer in Australia.
Fuels used for generation by autoproducers represent single fuel-fired units only. The use of fuel in multi-fired units operated by autoproducers is included in industry consumption.

In the 2018 edition, new methodologies were introduced by the Australian administration for reporting electricity production from solar sources. First, the methodology for reporting electricity production from solar PV and solar thermal was changed between 2009 and 2010, resulting in a break in time series. Prior to 2010, the ratio of electricity production from solar thermal to total solar was assumed to be the same each year. After 2010, solar PV autoproducer electricity production is the residual after the main activity solar PV and solar thermal are deducted from total solar production. There is an additional break in time series between 2013 and 2014 for solar production when a new methodology for determining large-scale solar PV production was introduced for main activity solar PV plants.

In the 2017 edition, following an extended review of past data, the Australian administration revised electricity outputs of blast furnace gas autoproducer electricity plants for the period 2003-2004 and of autoproducer CHP plants fuelled by other oil products for 2009, resulting in more realistic efficiency rates for these plants.

In 2002, the Australian administration started to use a new survey methodology and reclassified the types of plants between main activity producers and autoproducers.

Prior to 1995, electricity production from biogases is included in natural gas.

Prior to 1986, inputs and outputs from autoproducer CHP plants are not available.

**Consumption**

The 2021-2023 editions incorporate successive revisions to sectoral consumption provided by the Australian administration. These affected data back to 2009 (2021-2022 editions), and 2015 (2023 edition). In particular, data for Construction were significantly revised in the 2022 edition. This also affected transmission and distribution losses which act as a balancing item. Breaks may occur between 2008 and 2009.

The significant growth in electricity consumption at LNG/regasification plants in 2016 and 2017, is due to the commencement of large-scale production at Australia’s new east coast LNG plants.
From 1990 to 2008, electricity consumption in wood and wood products is included together with paper, pulp and printing.

Prior to 2006, electricity consumption in mining and quarrying includes consumption in liquefaction/regasification plants.

The direct use of solar heat (mostly domestic solar panels) is available from 1974.

Electricity consumption in coke ovens has been estimated by the Australian administration from 1974 to 1999.

Prior to 1974, the breakdown of electricity consumption in industry and energy sub-sectors is not available and energy industry consumption is included in industry.

Electricity consumption in the non-specified transport sector represents transport support services, including those for air and water transport, and for transport for mining operations.

Prior to 1971 electricity consumption in the commercial and public services sector is included in industry.

Reported electricity consumption in the oil and gas extraction sector may include some consumption in LNG/regasification plants.
Austria

Source
Bundesanstalt Statistik Österreich, Vienna.

General notes
Starting with the 2016 edition and following, widespread data revisions were received due to enhanced reporting from 2005 onwards as a consequence of improved Austrian Final Energy Consumption surveys. For some time series, these revisions were extrapolated back to 1990. As a consequence, there may be breaks between 2004 and 2005, and 1989 and 1990. For more details on the methodologies in the revisions in the energy balance, there is more information here: http://www.statistik.at/wcm/idc/idcplg?IdcService=GET_PDF_FILE&RevisionSelectionMethod=LatestReleased&dDocName=036412

For more details on the methodologies related to consumption in households, there is more information here: http://www.statistik.at/wcm/idc/idcplg?IdcService=GET_PDF_FILE&RevisionSelectionMethod=LatestReleased&dDocName=078265

Coal

General notes
In the 2021 edition, revisions were made in several products for the period 2005-2018, most of them were small in absolute and/or relative value.

In the 2019 edition, revisions concerning the iron and steel industry were received for data since 2005. The revisions impacted the energy sector for coke oven gas and blast furnace gas.

In 2018 data, blast furnace gas decreased following maintenance work in one of the blast furnaces. Additionally, other recovered gases (LD-gas) are reported separately following an improvement in reporting from the 2020 edition (in previous editions it was reported under blast furnace gas).

The last lignite mine closed in the second quarter of 2004 and lignite use for power generation ceased in 2006.
Since 1996, gas works gas data are reported with natural gas because it is distributed in the same network. The amount of gas works gas is negligible and it is mostly consumed by households.

“Trockenkohle” is included with BKB because of its high calorific value.

Supply
In 2018 there were high values of patent fuel imported and consumed in the paper and pulp industry, which was not the case in 2019.

Consumption
In the 2023 edition, the final energy consumption in industry and other sectors of several products was revised for 2020 due to new available information from national surveys.

One of the revisions made in the 2021 edition was the reallocation of some quantities from Blast furnace (energy) to Coke oven (Energy) for the products blast furnace gas, coke oven gas and other recovered gases.

Among the revisions made in the 2021 edition, some quantities of coke oven coke were reallocated from the industry Iron & Steel (TFC) to the category Non-Energy Use-Chemical/ Petrochemical.

Oil
General notes
In the 2022 edition, revisions in the time series for gas/diesel oil deliveries for international marine bunkers appear as a result of a change in the methodology reported by the Federal Environment Agency to Statistics Austria. As a consequence of this change in methodology, revisions also appear for gas/diesel oil consumption in road transport and domestic navigation from 1990 onwards.

Supply
In 2022, the decrease in crude oil inputs to refineries and gas/diesel oil refinery output is due to an accident which primarily impacted inputs of the former and outputs of the latter.

In the 2021 edition, the Austrian administration revised the stock levels (national territory) of motor gasoline (from 2006 onwards) and fuel oil (from 2005
onwards) but with the stock changes preserved as in the previous edition. A stock break appears for fuel oil between 2004 and 2005.

In the 2016 edition, exports of naphtha are no longer reported from 2014, past values may refer to exports of petrochemical raw material.

Deliveries of gas/diesel to international marine bunkers were revised back to 1990 after implementation of a new study results.

Prior to 1990, a portion of naphtha is included with other oil products.

**Transformation**

In the 2019 edition the administration incorporated revisions as a result of improved reporting from the refinery to Statistics Austria. As a result there may be breaks in the time series between 2004 and 2005.

**Natural gas**

**Supply**

In the 2023 edition, trade data was revised back to 2005 due to a change in methodology to eliminate the reporting of transit trade. This results in no exports reported and a decrease in imports. In the 2022 edition, the time series for Opening and Closing stock level (National Territory) was revised in Terajoules from 1990 onwards due to new information becoming available from data providers.

Export amounts are calculated by the national administration by subtracting stock changes and domestic consumption from import figures.

**Transformation**

In the 2018 edition, the time series for blast furnaces was reclassified from 1990 onwards, and thus moved from the Transformation to the Energy sector. This has resulted in increasing the efficiency of the blast furnaces process.

Between 1995 and 1996 there is a break in time series for autoproducer electricity and CHP plants due to the availability of more detailed data.

**Consumption**

In the 2019 edition, Austrian administration revised oil and gas extraction and oil refinery natural gas consumption data for 2005 onwards based on data reported...
to the Emissions Trading Scheme (ETS). Additionally, it revised data since 2005 for other sectors’ flows since 2005 and industry sector since 2012 based on a combination of the results of sample surveys and data from the regulator.

Any inconsistencies in the time series for commercial/public services until 2011 are the result of this sub-sector being computed as a residual. Since 2012 the commercial/public services consumption figures are surveyed annually and the consumption quantities in small and medium enterprises in industry are the projected results of biannual sample surveys. The increase in pipeline transport consumption for 2013 is due to a new methodology of data collection. Historical revisions are pending. Prior to 2000, differences due to measurement are included with distribution losses.

Biofuels and waste

General notes

Data for 1986 to 1989 for solid biofuels, industrial waste, biogases and liquid biofuels are IEA Secretariat estimates based on information published by OSTAT in Energieversorgung Österreichs Endgültige Energiebilanz.

Consumption

In the 2016 edition, improvement in the iron and steel industry data have allowed more precision in the consumption, among other for industrial waste in blast furnaces.

In the 2016 edition, the consumption of solid biofuels in the residential sector was revised down from 2005 data.

Electricity and heat

Supply

Amounts for both net electricity production and plant own use are calculated by the Austrian administration by applying a fixed percentage multiplier to the gross production of all plants in the public grid, regardless of plant type or fuel.

Electricity production from geothermal main electricity plants only refers to electricity that is fed into the grid. Total production is not known as these plants are below the reporting threshold.
Transformation

For 2020, the decrease in electricity and heat output from other bituminous coal was in part due to the closure of a power plant.

Electricity only plant data may include some CHP plants operating in electricity only mode. In addition, fuel inputs to and electricity outputs from CHP plants are re-allocated from CHP to electricity-only plants if the implied CHP efficiency would fall below 75%.

Fluctuating efficiencies from year to year for solid biofuel and industrial waste plants are related to operational decisions which are governed by a formula described in the Standard documentation Meta information on Energy balances for Austria and the Länder of Austria published in June 2016 on the Statistics Austria website.

In the 2018 edition, electricity production from municipal waste main activity electricity plants was revised from 2003-2009. Additionally, electricity production from municipal waste main activity CHP plants was revised in 2014.

A large autoproducer electricity plant was reclassified as an autoproducer CHP plant and therefore creates a break in time series for municipal waste in 2011.

In 2009, inputs of other oil products to autoproducer CHP plants were reclassified as refinery gas and natural gas.

Due to a change in the survey methodology, the heat produced in small plants (capacity inferior to 1 MW) is not reported starting in 2002.

Heat from chemical processes used for electricity production is available from 2000.

Electricity generation from geothermal started in 2002.

Prior to 2002, data for biogases only include plants of 1 MW or larger.

Prior to 1981, inputs to main activity producer electricity plants include inputs to CHP plants. All electricity production by CHP plants is included in electricity plants, and only production from combustible fuel sources is taken into account. Autoproducer CHP heat production is included in main activity producer CHP plants. For heat, own use is included in distribution losses.
Consumption

In the 2024 edition, Austria revised transport data back to 2017 based on new information available.

In the 2020 edition, Austria revised consumption data back to 2013 based on a new methodology for disaggregating consumption across sectors.

In the 2020 edition, a large portion of electricity consumption in blast furnaces was reallocated to iron and steel sector from 1990 to 2004. This creates breaks in series in these timeseries between 2004 and 2005. Revisions to data for 2005 onwards are expected in a future edition.

Electricity consumption in Road includes trams, trolleybuses, subways, cableways, chair- and drag-lifts, as well as 100% electric vehicles.

In the 2019 edition, Austria revised data back to 2005 in order to present international reporting as consistent as possible with the national energy balances. In addition, consumption figures were revised based on more recent surveys of energy consumption in small and medium-sized enterprises. Outliers and the extrapolation methodology will be revised following the results of the next survey.

Electricity consumption in oil refineries includes consumption in gas works plants prior to 1991.

From 1990 to 2009, small amounts of electricity used in heat pumps have been included in the residential sector.

Starting in 1990, consumption of electricity in the field of electricity supply, district heating and water supply are included in other energy industry own use, prior to that it was included in commercial/public services.

Also prior to 1991, electricity consumption in the iron and steel industry includes consumption in coke ovens and blast furnaces.
Belgium

Source
Observatoire de l'Energie, Brussels.

Coal

General notes
Trade flows for anthracite include transit trade. This will be amended in the next publication.

Oil shales and sub-bituminous coal have been grouped due to confidentiality reasons.

In the 2020 edition, data from 2013 was revised, and sub-bituminous coal figures are now reported under this category, whilst previously they were under other bituminous coal. BKB figures has been also revised back to 2013.

In the 2016 edition, improved data collection has led to some breaks in time series. These revisions include hard coal classifications, products and processes in integrated iron and steel manufacture and may be extended further back in future editions.

Data for anthracite prior to 2014 may include a small portion of other bituminous coal.

Hard coal data prior to 1978 may include sub-bituminous coal.

Other bituminous coal and sub-bituminous coal data reported in from other sources refer to coal recuperated from coal dumps.

Supply
Supply-side data are obtained through surveying questionnaires instead of customs data.

Transit trade is excluded. For each country (trade partner), the imported and exported quantities are compared and cleared. In the case of Belgium, this decreases the final figure of exports. 2019 data shows a rise in exports of other bituminous coal; the imports decreased during that year but some companies continued to export the stocks originated from those countries in 2019, leading to this rise.
In the 2019 edition, the calorific values of imported *bituminous coal* were revised upwards by the Belgian administration since 2015, resulting in a significant increase in the coal primary energy supply. Historical revisions are pending.

Conventional production of *other bituminous coal* ceased on 31 August 1992.

**Transformation**

A significant portion of the *coke oven gas* produced in the coke ovens is fed back to the coke ovens as an energy source (reported in the energy sector/coke ovens flow). This quantity should be taken into account when calculating the energy efficiency of coking processes.

In the 2019 edition, *anthracite* previously reported as consumption in the *iron and steel industry* was reclassified as part of the transformation process in *blast furnaces* since 2013.

In 2016, the decrease of *other bituminous coal* inputs to main activity producer electricity plants was due to the permanent closure of Langerlo, Belgium’s last coal-fired main activity electricity.

In 2015, the decrease of *coke oven gas* inputs to autoproducer CHP plants is due to a power plant closure in 2015.

In 2014 and 2015, *cooking coal* inputs to coke ovens decreased due to a coke oven closure in June 2014.

In 2014, the decrease of *other bituminous coal* inputs to main activity producer electricity plants is due to a power plant closure in 2014.

**Consumption**

In the 2021 edition, consumption of *other bituminous coal* in the sectors of Transport/Rail and Other sectors/Agriculture were included starting in 2015.

In the 2018 edition, industrial consumption for the period 2013 through 2015 was revised for *cooking coal* and *anthracite*, as more accurate consumption data became available. Data for *cooking coal* prior to 2013 may include a small portion of *anthracite*.

The decrease of *other bituminous coal* and *coke oven coke* in the iron and steel industry in 2002 is due to the closure of several plants.

The use of *coke oven gas* in chemical and petrochemical activities ceased in 1996.
Oil

General notes
Between 2008 and 2009 breaks in series occur for naphtha and LPG in both transformation and final consumption in the petrochemical sector as a result of methodological improvements made by the Belgian administration.

Data on biofuels are not available before 2009.

Other hydrocarbons correspond to pure hydrogen used in refineries.

Supply
Following a change in legislation, there is an increase in blended biodiesel in 2020.

In the 2022 edition, the Belgian administration revised petroleum coke imports and inland deliveries from 2015 onwards.

In 2019, the increase in refinery gross output of petroleum coke is due to a new delayed coker unit.

In 2018, increase in imports and deliveries for international marine bunkers of residual fuel oil is due to the inclusion of volumes of aromatic oils.

In 2017 new legislation increased the biofuel blending target for motor gasoline from 4% of volume to 8.5% of volume. As part of this E10 gasoline was introduced and became the new standard product in the country.

In the 2019 edition, the Belgian administration included new companies in their reporting; some of which are particularly active in the production and trade of lubricants and bitumen.

Consumption in international marine bunkers dipped in 2014 and 2015 due to the closure of several bunkering companies. During 2015 these were replaced by new companies which became fully operational in 2016.

Starting from 2013, a new data source was introduced for petroleum coke trade.

Transformation
In 2017 the upgrade project of Antwerp refinery and petrochemical plant was completed. Two key projects were completed: new refinery capacity for the conversion of heavy fuel oil into low sulphur light products and increasing steam
cracker flexibility to maximize the processing of low cost advantaged feedstock. The latter is reflected in feedstock needs. Output of lighter end products as well as petroleum coke is impacted by these upgrades.

In 2002, patent fuel plants used fuel oil to increase the calorific value of patent fuel.

**Consumption**

In the 2023 edition, the Belgian administration revised the consumption data from 2009 onwards.

In the 2021 edition, the Belgian administration revised the consumption data for *lubricants* from 2010 onwards as a result of the identification of new active players in the market. Breaks may occur in the series between 2009 and 2010.

In 2018, a project in a petrochemical plant in Antwerp has started in which *refinery gases* are treated to recover valuable hydrocarbons. These quantities are reported under *LPG* and reflect the increase observed for non-energy use in the petrochemical industry in 2018.

The decrease of *fuel oil* in industry consumption since 1993 is due to the introduction of an excise tax as well as increased use of natural gas.

**Natural gas**

**General Notes**

In the 2022 edition, historical revisions were made back to 2013 due to better data availability and harmonisation with other gas data.

**Supply**

Since 2020, the consistent increase of *from other sources – renewables* is an expected trend as more injection points of biomethane become active and increase production. The trade data from 2018 onwards include transit figures as a result of a change in methodology.

Since 2009 gas trade in Belgium includes imported LNG which is regasified and subsequently exported to other countries.

In the 2019 edition, the LNG consumption data in *international marine bunkers* are confidential.
Transformation

New reporting of blast furnaces in the 2022 edition, this is linked to the recent installation of a DRI-plant which uses natural gas to replace coal for the reduction of iron ore.

The Belgian administration is in the process of revising 2010 and 2011 transformation sector data. As such, an unusually high quantity of natural gas is reported under not elsewhere specified (transformation).

Between 2008 and 2009, there is a break in efficiency of natural gas autoproducer CHP plants due to a change in methodology regarding the reporting of unsold heat.

Consumption

In 2018 refinery gas started being further purified into products, leading to a higher consumption by oil refineries.

Consumption in the transport equipment sector decreased in 2015 due to the closure of a large industry of this sector in December 2014.

In 2003, the large decrease in non-specified industry consumption is due to improvements in data collection.

Since 2000, natural gas began to replace blast furnace gas in the iron and steel industry.

Biofuels and waste

General notes

Renewable municipal waste includes a share of renewable industrial waste.

Data for biodiesels and biogasoline are available starting in 2009.

In the 2023 edition, Belgium revised data back to 2004 due to improved data availability and change of methodology.

Supply

The increase in imports of industrial and municipal waste for 2022 is due to new information available in the 2024 edition.
Data on pure biogasoline and biodiesels trade are not available for 2009 and 2010.

**Transformation**

In 2015, part of the law regulating the blending of biodiesel with diesel was temporarily suspended but in 2016, this law was reinstated.

**Consumption**

In the 2024 edition, improvements in methodology and classification of the statistics collected by a data provider resulted in new consumption flows and breaks in the time series of some industrial subsectors of primary solid biofuels for 2022.

Consumption of bioethanol increased in 2017 due to legislation coming into effect on 1 January 2017, which increased the blending obligation for gasoline products.

Industrial waste consumption in the chemical sector started in 2011.

Other liquid biofuels consumed in power plants reported before 2011 can include biodiesels.

New data on consumption cause breaks in time series for primary solid biofuels between 2011 and 2012.

**Electricity and heat**

**General notes**

In the 2022 edition, Belgium revised data back to 2014 due to improved data availability, and improved natural gas data.

In the 2021 and 2020 editions, Belgium revised data back to 2010 and 2014 respectively.

**Supply**

In the 2023 edition, transmission and distribution losses of heat were revised back to 2014 due to new measurements of heat losses. Data before 2014 will not be revised.

In 2019, the increase in electricity exports is mainly due to the opening of the NEMO-Link interconnector between Belgium and the United Kingdom.
Electricity production from other sources mainly comprises production at a gas expansion station with heat recovery and at a hydraulic turbine in a waste water treatment plant.

From 2013 onwards, reported heat distribution losses decreased due to a more precise estimation method.

The production of electricity from wind is available from 1987.

**Transformation**

Changes in ownership resulted in production by Autoproducer CHP plants with Municipal Waste in 2022. Values of other bituminous coal input and output for Autoproducer CHP plants were adjusted due to confidentiality reasons for 2022, 2021, 2020 and 2019.

In 2020 and 2018, electricity output from nuclear decreased due to outages at a number of reactors.

Langerlo, Belgium’s last coal-fired main activity electricity producer closed permanently in March 2016.

Heat production from chemical processes used for electricity production is available from 2005.

In 2012, heat production from chemical sources has been estimated by the IEA Secretariat.

Offshore wind production in Belgium commenced in 2009. Data are available from 2010.

Prior to 2009 some unsold heat was reported in natural gas autoproducer CHP plants, together with the associated natural gas input. This causes the drop in efficiency in 2009.

In 2007 data, no information was available on heat production in main activity CHP plants for industrial waste.

In 2003, combustion of municipal waste for electricity and heat generation purposes increased significantly. However, because a large portion of the heat produced is not used (sold), plant efficiencies dropped significantly between 2002 and 2003.
In 2000, most autoproducer electricity plants using combustible fuels were reclassified as autoproducer CHP plants; the heat production from these plants was used for internal industrial processes and not sold to third parties until 2005.

For 1998 and 1999, electricity production at main activity producer CHP plants with annual heat output below 0.5 TJ is reported with main activity producer electricity only plants.

Prior to 1982, electricity production in main activity producer CHP plants is included in production from electricity plants. Also, inputs of fuels for electricity generation in main activity producer electricity plants include inputs for heat production in CHP plants.

Consumption

For 2022, a change in methodology by one data provider to calculate electricity consumption in the residential sector contributed to a drop of consumption. Prior to 2022, solar PV production of small-scale PV-installations (PV < 10 kW) were added to the consumption figures in the residential sector.

In the 2023 edition, heat consumption was revised back to 2014 due to new measurements of heat losses.

In 2018, the methodology use to allocating heat consumption between the residential, commercial and public services, and agriculture and forestry sectors by one data provider was changed, resulting in some breaks in-series.

Electricity consumption in Road includes some consumption by electricity vehicles (EVs), based on vehicles numbers distances travelled. However, coverage of hybrid vehicles varies across regions. In addition, not all charging is included. Therefore, some consumption by EVs is still included under Residential.

In the 2019 edition, revisions were implemented for the direct use of solar thermal in other sectors back to 2010 due to improved data availability.

For 2012, electricity consumption in the mining and quarrying sector has been estimated by the IEA Secretariat.

For 2012, oil refineries electricity consumption has been estimated by the IEA Secretariat based on refinery activity data. Part of the estimated amount has been removed from consumption in the chemical and petrochemical sector.
Breaks in time series may exist between 2007 and 2008 due to revisions of the Classification of the Economic Activities in the European Community (NACE) classifications.

There is no heat consumption starting in 2007 in the iron and steel industry because the installation concerned became an autoproducer in July 2006 and the heat is no longer sold.
Canada

Source

Natural Resources Canada, Ottawa.

General notes

In the 2018 edition, data for Canada were revised back to 2005 following a ten year revision of the Report on Energy Supply and Demand (RESD), the main set of Canadian annual data. The revision standardizes the methodology used for the IEA data submission and has mainly affected the demand side. Additional details are given under each fuel.

Coal

General notes

The 2022 edition includes revisions to coal production starting in 2015.

The 2021 edition includes some revised data as the methodology implemented in the previous edition was further refined by the Canadian administration.

The 2020 edition includes revisions for all the time series by the Canadian administration as more accurate data was available.

Significant statistical differences can be observed for several coal products. This is under investigation and further improvements are expected in further editions.

In the 2018 edition, data for Canada were revised back to 2005 following a ten year revision of the Report on Energy Supply and Demand (RESD), the main set of Canadian annual data. The revision standardizes the methodology used for the IEA data submission and has mainly affected the demand side.

In the 2017 edition, due to the extensive revisions of the Report on Energy Supply and Demand (RESD), significant statistical differences can be observed for several
coal products for the period 2005-2015. In the 2016 and 2017 edition, extensive revisions for the period 2005 to 2015 were received as more data became available due to improvements in data collection.

In the 2014 and 2015 editions, some revisions to the 2004 to 2006 data were received in addition to some time series and products for 2007 to 2011.

Due to a Canadian confidentiality law, it is not possible for the Canadian administration to submit disaggregated time series for all of the coal types. Between 2002 and 2006, the IEA Secretariat has estimated some of the missing time series. The data for 2007 onwards are given directly as reported, however data may be present in non-representative products, and additionally these ad hoc reclassification methodologies contribute significantly to larger than normal statistical differences across products.

At this point in time, oil shale and oil sands data are not submitted, and this energy source is deemed to enter the supply stream as shale oil (other hydrocarbons).

Supply

Production of other bituminous coal increases considerably in 2022 data due to the reopening of some mines (Westmoreland’s coal valley mine and Vista coal mine) while production of sub-bituminous coal decreases due to the closure of other mines (Highvale mine and Sheernees mine).

In the 2023 edition, total imports and exports as well as imports by origin and exports by destination of coking coal, other bituminous coal and coke oven coke were revised for 2019 and 2020 by the Canadian administration.

Due to confidentiality constraints, from 2014 the breakdown of production by type of coal is estimated by the Canadian administration, while stock changes and statistical differences are estimated since 2001.
Transformation

In December 2018, Canada announced regulations to phase-out traditional coal-fired electricity by 2030.

Injection of pulverized coal into blast furnaces (PCI) occurs, but is not available for confidentiality reasons. Coals consumed in this manner are reported in the iron and steel industry along with other consumption.

Before 1978, lignite inputs to main activity producer heat plants are included in final consumption. Starting in 1979, these inputs are included in main activity producer electricity plants.

Consumption

In the 2023 edition, the Canadian administration reported a new consumption of lignite in non-energy use for 2020 and 2021. The exact classification of this use is under discussion and may be subject to changes in the following editions.

In the 2023 edition, the Canadian administration revised the methodology to report disaggregated final consumption of coal in order to better reflect official data while still protecting confidentiality. This led to revisions of non-energy and industry consumption flows of many primary and secondary coal products for 2019 and 2020.

Data of consumption of anthracite in the iron & steel sector is confidential. The Canadian administration provides an estimate.

Since 2001, consumption of anthracite in non-energy use is estimated by the Canadian administration.

Due to the unavailability of data, non-energy use of coke oven coke and hard coal is included with final consumption sectors prior to 1978 and 1980, respectively.

Oil

General notes

In the 2024 edition, several breaks can be observed for petroleum coke due to the new reporting methodology of the Canadian administration.

Several breaks in series appear between 2018 and 2019 due to the new Monthly Refined Petroleum Products (MRPP) survey launched by the Canadian
administration in the beginning of 2019. The survey, redesigned to better reflect the evolution of the refined petroleum industry, includes greater coverage of all products.

The 2018 edition includes numerous time series revisions for the years 2005-2016. This is due to the 10 year revision of the Report on Energy Supply and Demand, which is the main set of Canadian annual data. The majority of these revisions were applied to the demand side.

In the 2016 edition, the Canadian administration was able to reconcile some historical inconsistencies by reporting inputs and outputs to upgraders. In the supply side, these quantities are reported under other hydrocarbons. In the demand side, they are reported under the respective output products (refinery gas, road diesel, and petroleum coke).

Time series for other non-specified oil products may fluctuate as they have been computed as residuals.

Receipts from non-reporting companies are currently represented in the statistical difference flow, work is ongoing with the Canadian administration to address gaps in the coverage that lead to increasing statistical differences.

Supply

In the 2023 edition, significant shifts in the balances of refinery gas, petroleum coke and other oil products are reported by the Canadian administration from 2019 data onwards, in line with the revisions in the MRPP.

In the 2023 edition, LPG exports from 2019 onwards have been eliminated, following determination by the Canadian administration that the previous estimation method was overstating the total volume of exports.

In the 2022 edition, the Canadian administration no longer reports imports of additives/oxygenates from 2019 onwards. As these amounts refer to hydrocarbon-based motor gasoline blending components, they are therefore included in the imports of this oil product.

The Sturgeon refinery began operations in late 2017. The refinery produced its first diesel fuel in December 2017. It primarily processed synthetic crude oil but has successfully transitioned to bitumen.

In the 2018 edition the domestic supply of crude oil was revised due overall revisions to the Report on Energy Supply and Demand and the inclusion of additional data sources in the reporting.
From 2014 data the Canadian administration started using customs based trade data to report crude oil imports. In the 2017 edition, crude oil imports data have been revised back to 2005 following this methodology. Some revisions to imports of secondary products have already been made and further revisions are expected.

Condensates and pentanes plus are included in crude oil from 2005, in NGL 1990 to 2004 and in LPG prior to 1990. Historical revisions are pending.

From 2005 primary oil products include direct imports of condensates by crude oil producers.

Production of other hydrocarbons represents synthetic crude oil produced from tar sands.

From 2005, other hydrocarbons from other sources natural gas corresponds to natural gas used for the upgrading of synthetic crude oil (reported under GTL transformation in the natural gas consumption data) and natural gas used to upgrade petroleum products (reported under non-specified transformation in the natural gas consumption data). Revisions to this flow were introduced in the 2019 edition. From 1990 to 2005, these quantities are reported in indigenous production of other hydrocarbons. Prior to 1990, they are included in the natural gas supply.

Imports of other hydrocarbons from 1994 to 2000 correspond to orimulsion imports from Venezuela.

Refinery output from gas/diesel oil and petroleum coke includes output from oil sands and upgraders.

The Canadian administration is currently unable to provide a figure for the domestic production of additives, but is working on solutions which will make this possible. Meanwhile, significant statistical differences can be observed for several secondary oil products.

**Transformation**

In the 2023 edition, the Canadian administration reallocated inputs of other oil products for electricity production in main activity producers to motor gasoline from 2005 onwards.

**Consumption**

In the 2024 edition, the Canadian administration reported data for energy-use in wood and wood products from 2005 onwards for other kerosene.
In the 2024 edition, the Canadian administration revised consumption of gas/diesel oil for energy-use in oil and gas extraction from 2005 onwards.

In the 2023 edition, the Canadian administration reported data for energy-use in iron and steel and chemical (including petrochemical) from at least 2017 onwards for other kerosene, gas/diesel oil and fuel oil. Data for previous years remain confidential or not available.

In the 2023 edition, the Canadian administration revised the split of deliveries of aviation fuels between international and domestic aviation from 2004 onwards. Furthermore, consumption for military use is reported under not elsewhere specified (transport) from 2004 onwards.

In the 2022 edition, the Canadian administration reports refinery gas, gas/diesel oil and petroleum coke consumption by crude bitumen upgraders in the oil/gas extraction sector from 2019 onwards.

In the 2022 edition, the Canadian administration provides newly-available data for petroleum coke consumption for energy-use in non-ferrous metals, chemical and iron and steel sectors from 2019 onwards. Prior to 2019, they remain confidential.

In the 2021 edition, the Canadian administration has moved the consumption of aviation gasoline from commercial and public services to domestic aviation from 2013 onwards. Similarly, consumption of jet kerosene in non-specified (industry) has been moved to domestic aviation from 2013 onwards.

In 2019, the increase in refinery fuel use of refinery gas is due to the inclusion of refinery fuel used by upgraders. Prior to 2019, this is included in the oil and gas extraction sector.

In the 2020 edition in order to increase consistency with IEA’s Energy Efficiency Indicators methodology, the Canadian administration has moved the consumption of motor gasoline and gas/diesel oil from commercial and public services to road transport. Moreover, consumption of jet kerosene in commercial and public services has been moved to domestic aviation.

Due to confidentiality issues, consumption data for selected products and flows, such as fuel oil and gas/diesel consumption in iron and steel from 2009 up to at least 2016, are not available. For the same reason, selected products may include estimates provided by the Canadian administration, such as Fuel Oil and Bitumen data for 2014.
In the 2019 edition the data series for consumption in oil and gas extraction was revised back to 2005 by the Canadian administration as new data sources meant a more accurate distribution between this sector and mining is now possible.

*International marine bunkers* are included with inland waterways prior to 1978.

**Natural gas**

**General notes**

In the 2019 edition, the Canadian administration proceeded to data revisions from 2005 onwards based on the revised source statistics from Statistics Canada and with the aim of achieving greater consistency with the Energy Efficiency Indicators data submission to IEA.

**Supply**

*Indigenous production* is measured by the Canadian administration by upscaling the marketable production by approximately 11% to account for own-use in the extraction process.

*Associated gas* has been estimated by the Canadian administration for 2016 and 2017.

Prior to 2005, non-associated gas production data includes colliery gas as well as associated gas produced in Alberta.

**Transformation**

For 2000, the increase in main activity producer electricity is due to new generation plants in Alberta and Ontario.

Due to confidentiality reasons, the Canadian administration estimated natural gas consumption in oil refineries for the 2014-2017.

*Gas-to-liquids (transformation)* represents quantities of natural gas consumed in the production of synthetic crude oil.

*Non-specified transformation* represents quantities of natural gas used for the upgrading of refined oil products.
Consumption

In the 2019 edition, the oil and gas extraction consumption was revised back to 2005 in order to more accurately separate it from other mining/extractive activities.

In the 2019 edition, an improved methodology was applied to industry sector for 2005 onwards resulting in a share of the not elsewhere specified (industry) being allocated to various industrial sub-sectors and creating breaks between 2004 and 2005.

Distribution losses flow is computed as a balancing variable.

Due to confidentiality reasons, the Canadian administration estimated natural gas consumption in the following sectors for 2014-2017: iron and steel, non-ferrous metal, transport equipment and machinery.

For 2011, the increase consumption by non-metallic mineral production is due to switching from coal to natural gas in cement manufacturing.

Prior to 1990 data for consumption of natural gas for construction are not available.

Prior to 1978, consumption in non-specified industry includes gas used as fuel in oil refineries.

Prior to 1978, agriculture is included in industry, and no detailed industry sub-sector data are available.

Biofuels and waste

General notes

In the 2023 edition, some values for biogases, renewable municipal waste and non-renewable municipal waste were revised. The revisions are mainly in the transformation sector and cover the years 1990-2021.

In the 2022 edition, solid biofuels were significantly revised starting from 2016 due to the utilization of new data sources. This may lead to data breaks in the transformation sector between 2015 and 2016.

The split of municipal waste reported assumes 65% renewable and 35% non-renewable.
The IEA Secretariat has estimated the data for biogases, industrial and municipal waste from 1990 to 2004, biogasoline (ethanol) from 1998 to 2004 based on information supplied by Natural Resources Canada.

**Supply**

Canadian biodiesel production increased significantly in 2014 because a large producer came online at the end of 2013. In 2016 again, there was a big increase in production of biodiesel due to a large plant coming online in Alberta. This is also the reason for the increase in export, as Canada exports most of its biodiesel to the US.

There were no exports of biogasoline since 2013.

**Consumption**

In the 2022 edition, due to the utilisation of new data sources, data breaks are visible between 2004 and 2005 for solid biofuels.

**Electricity and heat**

**General notes**

In the 2020 edition, the Canadian administration provided revised data back to 2005 based on revised methodologies and sectoral alignments, and to incorporate additional data.

In previous editions, the Canadian administration also undertook revisions of many parts of the electricity time series back to 2005, based on the results of the Report on Energy Supply and Demand in Canada (RESD). In particular, revisions were made on the inputs and outputs of power plants fuelled by combustible fuels and on the breakdown of final electricity consumption, resulting in possible breaks in time series.

**Supply**

In 2019, the Annapolis Royal tidal power station closed.

In the 2018 edition, revisions were made to electricity production from wind back to 2013.

For 2017 onwards, fluctuations in electricity output from nuclear occur in part due to reactor refurbishment works. Staggered maintenance across various reactors
is scheduled for Darlington (2017-2027) and Bruce (2020-2034) power generation stations.

Discrepancies occur between respective reported figures for electricity trade between Canada and the US from 2016 onwards.

Autoproducer solar PV electricity generation is available from 2016. Prior to 2016, data are included in main activity producers. As a result, a break in series occurs for main activity producer solar generation between 2015 and 2016.

Starting in 2009, a new source has been used for electricity production from solar, wind, and tide. This new source covers production from solar and wind only from plants with capacity higher than 500 kW.

Heat production includes heat produced by nuclear power stations for distribution to other consumers up to 1997.

Electricity production from other sources mainly refers to steam and waste heat.

**Transformation**

For the 2022 edition, the Canadian Administration submitted revised data for solid biofuel, due to the incorporation of data from the Industrial Consumption of Energy survey alongside existing data from the Annual Electric Thermal Generating Stations survey.

For autoproducers generating electricity with process steam produced from biofuels and waste, the energy required to produce the initial steam is not taken into account by the Canadian administration and as a result the efficiencies are overstated.

In the 2016 edition of this publication, there was a reclassification from autoproducer to main activity producer for plants fuelled by biogases and municipal waste.

The breakdown of electricity and heat generation between natural gas and oil products in main activity producer CHP plants has been estimated by the Canadian administration starting in 1990. This may cause breaks in the time series between 1989 and 1990.

Net electricity production by autoproducers prior to 1990 includes production from combustible fuel sources only.

Inputs of fuels to heat plants are not available for 1979 to 1987.
Consumption

In the 2023 edition, the Canadian Administration used revised consumption data back to 2000, drawing on more detailed sectoral classification data available in the Industrial Consumption of Energy (ICE) survey.

Electricity consumption in road refers to consumption in establishments primarily engaged in truck transport services; the operation of urban, interurban and rural transport systems (including urban rail); school buses; charter and sightseeing buses, taxis and limousine services.

In the 2020 edition, data for several sectors were revised back to 2005 to improve accuracy and alignment with ISIC classifications. In particular, data previously reported under “non-specified” sectors were reallocated to specific sectors, and improvements were made to transmission and distribution losses. As a result, some breaks may occur between 2004 and 2005.

In 2017, the decrease in electricity consumption in the chemicals sector is partially due to a large consumer having been rotated out of the source sample survey used to compile the data.

Prior to 2005, transmission and distribution losses of electricity could include statistical difference for certain years.

Consumption of electricity in oil and gas extraction is not available prior to 1987.

Consumption of electricity in coal mines is not available between 1982 and 1986.

Chile

Source

General notes

Data are available starting in 1971.

To meet the deadline for the April 2024 publication, some estimations to the 2022 data were necessary to be made by the IEA Secretariat.

In the 2017 edition, data for 2014 and 2015 were revised to replace figures previously estimated by the Secretariat.

From 1990, consumption in paper and pulp includes forestry and consumption in agriculture is included in non-specified industry. In general, a new methodology has been applied for data since 1990, leading to other breaks in time series between 1989 and 1990.

Coal

General notes

Other bituminous coal data includes sub-bituminous coal, if present. For 2024 edition, sub-bituminous coal is reported for the first time.

In the 2023 edition, gas works gas balance has been estimated by the IEA Secretariat.

Supply

For 2024 edition, imports and consumption of sub-bituminous coal are reported for the first time.

In the 2023 edition, stock change data for all products and trade data for coke oven coke for 2022 were not yet available to the Chilean administration.

In the 2021 edition, imports and consumption of anthracite are reported for the first time. The time series has been completed back to 2015.
Consumption

In the 2024 edition, Coke oven gas was estimated by the IEA Secretariat for the data year 2022 based on the “Balance Nacional de Energía”.

Since 1990, consumption in paper and pulp includes forestry and consumption in agriculture is included in non-specified industry. In general, a new methodology has been applied for data since 1990, leading to other breaks in series between 1989 and 1990.

Oil

General notes

There are breaks in time series between 2008 and 2009 due to a change in methodology by the Chilean administration.

Supply

Receipts from other sources of other hydrocarbons correspond to natural gas used in refineries. These quantities are the results of not-elsewhere specified transformation in the Balances format.

Consumption

Starting with 2017 reference year data the administration can now identify consumption in construction and agriculture. Prior to these quantities were reported under not elsewhere specified.

Natural gas

General notes

The 2017 and 2018 values for not elsewhere specified transformation and oil refineries have been estimated by the IEA secretariat.

Supply

Chile started reporting exports of natural gas with 2016 data.

Data representing LPG injected into the natural gas distribution network are available starting in 2009. They are reported in from other sources - oil.
Transformation

For 2009 and 2010, inputs of natural gas to autoproducer CHP plants were estimated by the Chilean administration. For other years, these inputs are included in autoproducer electricity consumption.

Not elsewhere specified transformation represents natural gas that is blended with refinery gas.

Consumption

Natural gas used for oil and gas extraction is included in gas consumption for energy use in oil refineries.

Non-specified transport corresponds to marine transport.

Biofuels and waste

General notes

In the 2024 edition, the 2022 data figures have been estimated by the IEA Secretariat based on a combination of preliminary supply side data, submitted for this cycle and the 2022 energy balances published by the Ministry of Energy.

Supply

In 2021, there is no supply, transformation or energy/end use of Charcoal and Municipal Waste.

Production of landfill gas ceased from 2001 - 2014 as landfill sites stopped producing adequate gas to continue collection.

Transformation

In 2021, the input in main activity producer electricity – solar thermal and the solar collectors installed surface have been estimated by IEA secretariat

A new survey on primary solid biofuels causes breaks in production and input to autoproducer CHP between 2011 and 2012.

Consumption

Charcoal production and consumption have been estimated by the IEA Secretariat until 2013. From 2014 data, only solid biofuels input to charcoal production plant is estimated.
The Chilean administration applied a new revised methodology for final consumption of primary solid biofuels. This may lead to data breaks in time series between 2013 and 2014.

Electricity and heat

Supply
Electricity production from geothermal started at Cerro Pabellón in 2017.

In 2014, the Chilean administration applied a new methodology in the reporting of electricity generation from solar PV and wind, resulting in breaks in time series between 2013 and 2014. Revisions for previous years are pending.

The majority of electricity generation from other sources is from a conveyor belt transporting crushed rock from high altitude to lower altitude in a mine. A small amount from waste heat is also included.

Solar thermal heat production has been estimated by the IEA Secretariat using data published by Chilean ministry of energy.

Heat production from solid biofuels and biogas use in Main CHP plants is not available.

Electricity production from autoproducer hydro is self-declared, and as such, subject to variation.

Transformation
For 2019, the increase in electricity output from natural gas and the decrease in output from coal were due to the closure of some coal-fired power plants, and the resumption of natural gas imports from Argentina.

For 2014, data on inputs to transformation processes were taken from the published energy balance, and the output was estimated based on the efficiency reported in previous years.

Electricity production from other bituminous coal includes sub-bituminous coal.

Production of chemical heat used for electricity generation started in 2013. Besides chemical heat, data for heat production in CHP and heat plants are not available.
Increases in electricity from natural gas in 2010 are due to the openings of new LNG terminals.

The split of electricity generation by main activity and autoproducer by fuel was estimated by the Chilean administration for the period 1990 to 2003.

The variability of electricity output from oil products is in part due to the fact that oil-fired power plants are used for backup generation.

Consumption

Consumption in agriculture/forestry, and construction are available from 2017. For prior years, data are reported under Industry (non-specified).

Electricity consumption in mining and quarrying includes: coal mining; industry (non-specified) includes food, beverages, and tobacco; and wood and wood products; commercial and public services includes gas works.

Increases in electricity consumption in the road transport sector from 2014 onwards are the result of a new estimation methodology, while electric vehicles used for the transportation of ores are reported as consumption within the mining and quarrying industry.

Disaggregated data on solar thermal consumption by sector are not available. Therefore, all consumption is allocated to the non-specified other sector.

Prior to 2009, most statistical differences are included in distribution losses.
Colombia

Sources for Biofuels and waste:

General notes

Data for Colombia are available starting in 1971.

In the 2024 edition, most of the 2022 data have been estimated by the IEA Secretariat based on a combination of preliminary supply side data, submitted for this cycle and the 2022 energy balances published by the Colombian Unidad de Planeación Minero Energética (UPME).

In the 2023 edition, most of the 2021 data have been estimated by the IEA Secretariat based on a combination of preliminary supply side data, submitted during the 2021/22 cycle, the 2021 energy balances published by the Colombian Unidad de Planeación Minero Energética (UPME) and the partial submission by the Colombian administration during the 2022/23 cycle.

Historical revisions were not provided and some breaks in the time series can appear for 2018/2019.
Due to the new questionnaire layout used, minor revisions occurred for years 1990-2018, leading to minor breaks in the time series for 1989/1990.

In the 2020 edition, data for solar photovoltaic and biogas were added, based on new information from Unidad de Planeación Minero Energética (UPME) and the International Renewable Energy Agency (IRENA).

In the 2020 edition, the oil balance was revised based on new information from UPME, Asociación Colombiana del Petróleo (ACP), Refinería de Cartagena and Ecopetrol. Time series for paraffin waxes, bitumen and lubricants are now available from 1992 onwards. Petroleum coke data are available from 2016 onwards. Data for non-specified oil products are partially estimated by the IEA Secretariat, and include products such as arotar, slop, sulphur and propylene. Naphtha is revised from 2008 onwards to reflect UPME and Ecopetrol information on exports and imports. Transfers of naphtha for crude oil dilution are estimated by the IEA Secretariat. Crude oil stock changes and transfers are revised from 2010 onwards, as well as 2010-2013 supply and refinery input of crude oil to take into account the latest information from UPME.

In the 2020 edition, the correction of discrepancies in biodiesel and ethanol data leads to revisions in biodiesel, ethanol, diesel and motor gasoline data from 2005 onwards.

In the 2018 edition, time series for the period 2013-2016 were revised based on new energy balances received from UPME. Breaks in time series may occur between 2012 and 2013.

### Coal

#### General notes

In the 2024 edition, The IEA Secretariat revised the historical time series of the net calorific value of production for coke oven coke, to better reflect information from Colombian producers. As a result, the IEA Secretariat estimated also coking coal input in coke ovens transformation and coking coal production for the entire time series, to ensure consistency of the coking coal balance and coke ovens transformation efficiency.

#### Supply

In the 2024 edition, the IEA Secretariat estimated the production of anthracite, coke oven gas and blast furnace since it was not reported by the country.
In the 2024 edition, the IEA Secretariat estimated the production of **bituminous coal** between 2020 to 2022 due to the lack of available information.

In the 2022 edition, **coking coal** production was estimated by the IEA Secretariat for the data year 2020.

### Consumption

Data for non-energy use is not currently available.

In the 2024 edition, the IEA Secretariat estimated the distribution of demand of bituminous coal in the industry sector and other sectors for 2022 to avoid breaks in the time series.

In the 2024 edition, the IEA Secretariat estimated the use of coke oven coke in the blast furnace transformation and the industry sector based on OLADE’s report.

In the 2023 edition, the IEA Secretariat revised the 2020 figures of industry consumption for **coking coal** and **other bituminous coal** based on information from the energy balance and the Statistical Bulletin published by UPME.

### Oil

#### General notes

In the 2022 edition, data for Colombia prior to 1990 in the Oil Information may be different from those in World Energy Statistics due to a change in reporting methodology. The data from 1990 onwards reflect the conventions and methodologies of the IEA/Eurostat/UNECE annual oil questionnaire. As such, there may be breaks between 1989 and 1990.

In the 2021 edition, data for lubricants and paraffin wax are estimated by the IEA Secretariat.

#### Supply

In the 2022 edition, the Colombian administration reported stock changes in 2021 for several oil products. The stock change of crude oil in 2020 and 2021 may include some missing coverage in indigenous production. From 2010, products transferred of refinery feedstocks refer to naphtha blended with crude oil for dilution at refineries. Stock changes of some primary and secondary oil products are estimated by the IEA Secretariat.
Consumption

Consumption of jet kerosene for international aviation may include consumption for domestic aviation. Crude oil may be used at refineries to support refinery operations. From 1990 onwards, these are reflected in the statistical difference.

Biofuels and waste

General notes

In the 2024 edition, the 2022 data for municipal waste, primary solid biofuels, charcoal and some electricity generation and capacity figures have been estimated by the IEA Secretariat based on a combination of preliminary supply side data, submitted for this cycle and the 2022 energy balances published by the Colombian Unidad de Planeación Minero Energética (UPME).

2021 data are estimated by the IEA Secretariat based on OLADE and the Federación Nacional de Biocombustibles de Colombia for liquid biofuels.

Natural gas

General notes

No 2022 natural gas data was submitted to the IEA from the Ministry of Mines and Energy, therefore extensive estimations were required to be made by the IEA Secretariat. The estimations were made using a number of different sources including the Colombia Aggregated National Energy Balance, Colombia Natural Gas Market Manager Annual Report, data from other international organizations, and data from the other fuel questionnaires that were submitted.

In the 2023 edition, revisions were made back to 2006 for many flows in Final Consumption to align the data with the historical data of the Colombia administration. This has resulted in a break in the time series between 2005 and 2006.
Electricity and heat

General
In the 2023 edition, 2021 data for fuel inputs and electricity outputs from combustible fuel fired power plants have been estimated by the IEA Secretariat based on the 2021 energy balances published by the Colombian Unidad de Planeación Minero Energética (UPME) and data submitted by the Colombian Administration.

Supply
Due to the lack of detailed electricity own use data, net electricity generation and electricity own use by source have been estimated based on the total reported net to gross ratio for each year. Revisions are pending.

Transformation
Prior to 2019, inputs of residual fuel oil, non bio gas/diesel oil, and other kerosene to electricity generation are reported under the relevant fuel. However, the associated outputs are reported in aggregated format under other oil products. Historical revisions are pending.

Data for blast furnace gas use in autoproducer electricity plants have been estimated by the IEA Secretariat.
Costa Rica

Sources

Sources for 2016 onwards:
Secretaría Planificación Subsector Energía (SEPSE), San José
Organización latinoamericana de Energía (OLADE), Sistema de Información Energética de Latinoamérica y el Caribe, Quito

Sources up to 2015:
Direct communication with the Ministerio del Ambiente y Energía, San José.
Balance Energético Nacional, Secretaría Planificación Subsector Energía (SEPSE), San José, various editions.
IEA Secretariat estimates.

General notes

Data for Costa Rica are available starting in 1971.

Data for 2022 are largely estimated by the IEA secretariat by considering various sources.

In the 2022 edition, data were largely revised across all fuels for years 2016 to 2019, leading to large breaks in 2015/2016.

In the 2020 edition, due to clarification given by Secretaría Planificación del Subsector Energía (SEPSE), data for coke oven coke were revised to zero and corresponding figures reported as petroleum coke, for use in the cement industry.

In the 2020 edition, crude oil transfers and stock changes are revised between 2013 and 2015 to reflect the blending of remaining crude oil inventories with products after the closure of the refinery in 2011. As a result of this revision, NGL data is no longer reported. Transfers of fuel oil to gasoil are estimated in 2016 and 2017, while 2018 transfers data is reported by SEPSE.

Data previously reported in non-specified (other) consumption of gasoil is now reported in the construction sector from 2005.
In the 2019 edition, the IEA integrated revisions received from the country for the years 2006-2016. Most changes are for primary solid biofuels.

Coal

General notes
In the 2024 edition, no data were reported by March, leading to estimate all the values from different sources (UN COMTRADE and OLÀDE mainly).

Other bituminous coal and anthracite are reported together until 2015 and separated from 2016.

Consumption
In the 2024 edition, 2022 consumption data is estimated based on the 2022 national balance published by OLÀDE.

Oil

General notes
In the 2023 edition, the Costa Rican administration revised some data from 2016 onwards as a result of an update to the National Transport Survey that contained greater detail of sales made by RECOPE, the state oil company, to direct consumers. Breaks may occur between 2015 and 2016.

Consumption
In the 2024 edition, 2022 consumption data is estimated based on the 2022 national balance published by OLÀDE.

In the 2022 edition, non-energy consumption of bitumen is reported in construction for the time series. Previously, they were reported in non-energy use in industry/transformation/energy.

Biofuels and waste

General notes
For the 2024 edition, the IEA administration estimated all the 2022 data based on various secondary sources, as there was no submission of data from the Costa Rica administration.
Transformation

Solid biofuels CHP auto-producers are classified as electricity auto-producers before 2016.

Electricity and heat

Supply
Due to the lack of detailed electricity own use data, net electricity generation and electricity own use by source have been estimated based on the total reported net-to-gross ratio for each year. Revisions are pending.

Thermal electricity generation can show variation as the majority of electricity output is produced from hydro and wind.

Transformation
Prior to 2016, inputs of residual fuel oil and non-bio gas/diesel oil to electricity generation are reported under the relevant fuel. However, the associated outputs are reported in aggregated format under other oil products. Historical revisions are pending.
Czech Republic

Sources

Czech Statistical Office, Prague.

Ministry of Industry and Trade, Prague.

General notes

Due to ongoing review of energy data for 2010-2014, revisions have been made in the 2017 edition. Full details are given under each fuel.

Data are available starting in 1971.

Coal

General notes

Other bituminous coal data include sub-bituminous coal for all years if present.

The production and use of gas works gas ceased in 2020.

In the 2023 edition, the Czech Statistical Office revised coking coal and other bituminous coal imports for 2019 and 2020 as some coking coal was reclassified during resale within the country and consumed as other bituminous coal.

In the 2022 edition, calorific values were revised for the historical time series leading to revised input to main electricity producer plants and TES.

In the 2018 edition, data for the Czech Republic were revised back to 2010 based on administrative data causing breaks in time series between 2009 and 2010. These revisions impacted mainly industrial consumption for lignite, BKB and other recovered gases.

In the 2017 edition, coal consumption in the residential sector has been revised back to 2010 due to a new survey in households made by Czech Statistical Office, creating breaks in time series between 2009 and 2010.

Increased production and consumption of other recovered gases in 2014 is due to improved tracking of by-products from various transformation processes. Tail gases from the production of carbon black from coal tar are reported here, as are
off gases from the manufacture and cleaning of syngas from lignite for an IGCC plant.

Coal which had been previously classified as sub-bituminous coal until the 2008 edition is now reported under lignite for all years.

Revisions by the Czech administration have resulted in some breaks in time series between 2001 and 2002.

Data for 1990 to 1995 were estimated based on the Czech publication Energy Economy Year Book.

In 1995, town gas production (included in gas works gas) ceased.

Since 2010 BKB includes multipurpose brown coal dust for both supply and consumption.

**Supply**

In the 2021 edition, revisions were made for the period 2010-2018 to the consumption of other bituminous coal and lignite in Main Activity Producer CHP Plants and Main Activity Producer Electricity Plants. Only the structure changed, the total did not change. Revisions were also made to the calorific values of these products and flows for the same time period.

Mining in Lazy Mine was lowered until the closure of the mine in November 2019. This shows in the decrease of production of coking coal.

Imports of lignite for the year 2019p are expected to be revised upward in the next edition as more comprehensive data will be available.

**Other recovered gases** are combustible gases obtained during the production of gas works gas and as a result of chemical processes.

Production from other sources of other bituminous coal is from coal slurries.

A portion of other bituminous coal reported under from other sources for the period 2010-2015 correspond to reclassified coking coal.

Statistical differences for coking coal for the period 2010-2015 are partly due to the reclassification of coking coal to other bituminous coal.

**Consumption**

In the 2023 edition, most of the consumption of other bituminous coal in Mining and quarrying between 2016 and 2020 was removed as the Czech Statistical
Office discovered it was non-energy consumption already reported in the relevant flow.

In the 2023 edition, a new consumer of pulverized lignite (reported under BKB) was identified in Mining and quarrying sector, from 2011 onwards.

In the 2019 edition, coke oven gas in energy own-use consumed by electricity, CHP and heat plants was revised for 2016 resulting in a break in the series.

In the 2015 edition, improved reporting enabled revisions to be made for certain primary coal consumption flows between 2010 and 2012.

In the 2014 edition, residential consumption for the period 1990 through 2011 was revised for other bituminous coal, lignite, coke oven coke and BKB, as more accurate consumption data became available.

Due to economic restructuring in consumption in the late 1990s (big state enterprises subdividing and/or privatising and the utilisation of new technologies by businesses), there may be breaks in time series in these sectors.

Oil

General notes
Data prior to 1994 are estimated by the IEA Secretariat.

In 2016 both Czech refineries were affected by accidents which resulted in decreased refinery throughput, increased refinery losses and a large decrease in imports of crude oil offset by increased imports of finished products. The second accident affected the ethylene production unit and led to decreased activity in the petrochemical sector.

In 2017, the units previously affected by accidents were upgraded and operations resumed with increased output

Transformation
From 2002 data onwards, some amounts of fuel oil have been reclassified under other products. This change mainly affects the transformation sector.

Consumption
Between 1998 and 1999, breaks in gas/diesel final consumption time series are due to a new data management system implemented by the Czech administration.
Natural gas

General notes
Between 1993 and 1994 there are some breaks in time series due to a change in the energy balance methodology between former Czechoslovakia and the Czech Republic. Since 1993, data have been officially submitted by the Czech Statistical Office.

Supply
From 2013 all non-associated gas production was reclassified as colliery gas production.

Transformation
In the 2022 edition, the large increase in inputs for electricity generation in autoproducers is due to the cessation of energy gas production (gas works gas) in one company and its replacement by natural gas.

In 1996 natural gas inputs into gas works (transformation) ended.

Consumption
There is a break in time series in the industry and transformation sectors between 2009 and 2010 due to new available data from distribution companies.

Starting with 2008 data, hydrogen production is reported in chemical and petrochemical feedstocks as non-energy use. Up to 2007, chemical and petrochemical consumption includes both energy and non-energy use.

Prior to 1994 data in transport sector are for former Czechoslovakia.

Biofuels and waste

General notes
The restructuring of the Czech electricity market leads to breaks in the time series in all sectors between 1998 and 1999.

Data for municipal waste and solid biofuels are not available prior to 1990 and liquid biofuels data are not available prior to 1992.
Supply

The increase in the consumption of industrial wastes (non-renewable) in the non-metallic minerals sector in 2018 is related to increased demand from cement companies.

Transformation

For 2016 data, an increased excise duty was imposed on biofuels, causing a decline in consumption.

In 2016, a main activity producer CHP incineration plant fired by municipal waste was in test operation at Chotíkov.

Consumption

In the 2017 edition, due to a new survey in households made by the Czech Statistical Office in 2015 (ENERGO 2015), solid biofuels consumption in residential sector has been considerably revised upwards since 1990.

Hospital waste previously reported as municipal waste is reported under industrial waste since 2008.

Electricity and heat

General notes

In the 2021 edition, there were revisions for solar thermal from 2006 to 2018.

In the 2017 edition, data for the Czech Republic were revised back to 2010 due to the acquisition of new administrative data, allowing access to more accurate and detailed data sources. As a result, there are breaks in several time series between 2009 and 2010.

Data from 1990 onwards have been officially submitted by the Czech administration. This may lead to breaks in time series between 1989 and 1990.

Electricity statistics from 1971 to 1989 have been estimated by the IEA Secretariat except for final consumption and trade which were submitted by the Czech administration.
For 2017, apparent declines in autoproducer heat production by the chemical and petrochemical sector, and in consumption by petroleum refineries, occur due to the incorporation of an oil refinery into a neighbouring petrochemical enterprise.

**Supply**

In the 2024 edition, autoproducer electricity plant using “heat from chemical sources” was reported for the first time, thanks to data coverage improving.

Electricity from other sources includes output from ammonia, Styrofoam-derived liquid waste, unipetrol fuel gas, waste heat, and pressure reduction turbines on gas pipelines.

The amount of heat reported under other sources is primarily waste heat from the glass industry until 2009.

From 1999 onwards, small amounts of heat have been exported to the Slovak Republic.

**Transformation**

For 2020 data onwards, a new method was used to allocate data between electricity only and CHP plants. This result in some breaks between 2019 and 2020.

In the 2020 edition, a revision of the methodology for reporting the production of autoproducer plants running on combustible fuels removed multiple breaks in time series between 2009 and 2010 for CHP and electricity-only plants that were introduced in the 2017 edition.

For 2017, heat production from electric boilers and heat pumps is based on new survey data, whereas, data for prior years have been estimated by the Czech administration. As a result, some breaks in series may occur. Historic revisions are pending.

Electricity generated from waste heat in CHP plants is included with the total production from combustible fuels.

Data on heat own use and heat imports start in 2010 and 2009 respectively, following extensive revisions by the Czech administration in the 2017 edition due to the acquisition of new administrative data. Prior to this period, data are not available due to lack of sources.
The production of electricity reported in the category other fuel sources refers to electricity produced from turbines driven by the mixture of air, ammonia and other non-coal gases derived from the petrochemical industry.

From 2014, some autoproducer heat plants production figures became too small to appear in data collected.

From 2012 data, new autoproducer heat plants were added to the data collection, causing a break in time series.

In 2012, a main activity producer electricity plant using solid biofuels started to produce also heat and was reclassified as main activity CHP plant.

A different reporting methodology used by the Czech administration for biofuels and waste causes some breaks in time series between 2002 and 2003.

In 1999 and 2000, various big enterprises have been divided, sold and merged. This causes breaks in the time series of all types of plants.

Industrial waste use in main activity producer electricity plants is included with solid biofuels from 1996.

Data on biogases and waste used in main activity producer CHP and autoproducer heat plants start in 1993.

Prior to 1990, electricity production in main activity producer CHP and autoproducer CHP plants is included in main activity producer electricity plants.

Prior to 1990, heat production excludes heat sold by industry. In addition, heat production prior to 1990 is reported under main activity heat plants because the breakdown by producer and plant type is not available before then.

The breakdown of net electricity production by source is not available prior to 1990.

Data on heat production, and the corresponding fuel inputs, have been estimated from 1980 to 1989 based on consumption in residential and commercial/public services. Prior to that, inputs are included in industry.

Consumption

Data on electricity consumption by cable cars (reported under non-specified transport) are available from 2017.

Data for direct use of solar energy are available from 2003.
Denmark

Source

Danish Energy Agency, Copenhagen.

General notes

In the 2004 edition, major revisions were made by the Danish administration for the 1990 to 2001 data, which may cause breaks in time series between 1989 and 1990.

Coal

General notes

In the 2023 edition, the Danish Energy Agency informed us that they received new data regarding other bituminous coal and coke oven coke for two years before the latest submission year, and that this is likely to happen also in future cycles. The revisions concerned several flows of other bituminous coal balance for the years from 2018 to 2020, including stock change and transformation, and industry use of other bituminous coal and coke oven coke for 2019 and 2020. Furthermore, several calorific values of other bituminous coal were modified from 2019 onwards.

In the 2020 edition, the historical series for gas works gas have been revised and set to 0 for all flows. After a revision of the definitions it was concluded that there is no gas works gas transformation taking place in Denmark.

Supply

Trade data for other bituminous coal might include transit trade.

A large increase of steam coal imports in 2003 was related to a drought in Scandinavia. Thermal power plants were operated more intensively to replace hydro-generated electricity that was consumed in the country. Additionally, more coal-generated electricity was exported to other countries in the region. Significant fluctuations in demand are also evident for other years for similar reasons, including 2006 and 2013, but exist to a lesser extent.

Declines in stocks of steam coal stem from extensive deployment of renewable generation technologies and policy to further reduce Denmark’s utilisation of coal-
fired power and implement co-firing with renewable fuels as a part of their *Energy Strategy 2050*.

**Oil**

**General notes**

In the 2020 edition, as a result of resolved confidentiality issues, [biogasoline](#) and [biodiesel](#) are reported separately from 2012 onwards.

Starting with 2013 data the Danish administration reports products transferred to refinery feedstocks. In previous years refinery output is reported net of product transfers.

Between 1995 and 2004, [other hydrocarbon](#) imports and inputs to main activity producer CHP plants represent orimulsion.

From 1990 onwards, Greenland and the Danish Faroes are not included in the oil data.

Information on waste oil recycling and final consumption begins in 1989 and is reported in other oil products.

In 1988, consumption of [gasoline type jet fuel](#) ceased.

As of 1987, separate data for [paraffin waxes](#) are no longer available.

Prior to 1975, [refinery gas](#) is reported net of consumption in refineries.

**Supply**

In the 2023 edition, the Danish administration revised the supply data of [motor gasoline](#) as early as 2008.

Quantities of other hydrocarbons represent [natural gas](#) used by refineries.

**Transformation**

Due to improved survey methods, inputs to electricity and heat generation have been reclassified, causing a break in time series between 1993 and 1994. The oil inputs used in industrial sub-sectors for producing surplus heat, which is delivered to district heating networks, are allocated to these industrial sub-sectors.

In 1994, the marked increase in inputs to CHP production is due to increased electricity exports to Norway.
From 1974 to 1979, consumption of fuel oil for the CHP production by autoproducers has been estimated.

Consumption

Consumption data are based on a detailed survey sent to companies in Denmark every other year. For non-survey years, the consumption figures are estimated by the Danish Energy Agency.

White spirit and lubricants deliveries are estimated by Denmark.

For 1994 and 1995, industry detail is based on a new survey.

Prior to 1990, gas/diesel oil and fuel oil consumption for fishing are included in domestic navigation.

**Natural gas**

Transformation

In Edition 2020, gas works (transformation) were revised due to a change in the reporting methodology.

Consumption

The consumption of LNG for marine transport and international marine bunkers is not reported due to confidentiality.

The breakdown for industrial consumption for the latest year is estimated by the Danish administration using the previous year’s industry sector sub-sectoral shares and updated the following year.

**Biofuels and waste**

General notes

In the 2024 edition, the Danish administration estimated solar thermal final consumption and municipal waste (renewable and non-) exports for 2022 as equal to 2021, because these data are not available by the time of the publication. They are likely to be revised in the next ones.
Transformation

In the 2022 edition, the 2020 figure of heat generation from biogas heat autoproducer plants has been estimated by the IEA Secretariat.

From 2012, biodiesel production is confidential and gathered with imports.

Consumption

In the 2024 edition, consumption of biogases in road transport between 2018 and 2021 has been revised to 0 due to new available information and to avoid double counting of quantities already injected in the natural gas grid.

In the 2020 edition, the consumption of municipal wastes in the commercial and public services sector for 2017 data was revised.

In the 2016 edition, the Danish administration revised energy consumption in industry sectors causing some breaks in solid biofuels consumption between 2010 and 2011.

The data on the consumption of municipal waste in the industry sector are delayed by one year and the Danish administration duplicates the previous year’s data until the data become available.

The Danish administration estimates the growth in consumption of solid biofuels in the industry sector for the most recent year based on the growth in the transformation sector.

Electricity and heat

General notes

In the 2020 edition, there were revisions from 2010 to 2017 for solid biofuels, biogases and solar thermal.

Heat data are not available prior to 1976.

Supply

For 2019 data, the increase in heat output from electric boilers and heat pumps was due to the opening of new facilities. This also contributed to an increase in the coefficient of performance for heat pumps between 2018 and 2019.
In 2017, the declines in electricity and heat output from other bituminous coal and the corresponding increases in output from solid biofuels are attributable to fuel switching in co-fired plants.

The amount of heat reported under other sources is heat recovered from industrial processes and sold for district heating.

Heat produced for sale by heat pumps starts in 1994.

Geothermal and solar heat production for sale is available from 1989.

From 1984 onwards, small amounts of heat have been imported from Germany.

The production of electricity from wind is available from 1978.

**Transformation**

Efficiency of solid biofuels autoproducer heat plants dropped in 2022.

Revisions are pending.

Fish oil used in main activity producer heat plants is included with solid biofuels.

Due to the high number of heating companies burning wood chips that are equipped with boilers with flue-gas condensation, the solid biofuels heat plants show a high efficiency. The efficiency decline evident in 2016 was due to two less efficient plants switching to biofuels.

For some years, heat plants fired by natural gas, municipal waste, solid biofuels, biogases, and other oil products show efficiencies greater than 100%, on a net calorific value basis, due to the use of condensing boilers and other flue gas condensation technologies that recover the latent heat of vaporisation. Inclusion of small quantities of heat output from oil used alongside municipal waste in data for municipal waste may also affect efficiencies.

Biodiesels and biogasoline consumption for electricity and heat production are reported under other liquid biofuels, for confidentiality reasons.

Data for other liquid biofuels main activity heat plants are available back to 1994.

**Consumption**

For 2020, the breakdown of electricity and heat total final consumption is estimated by the Danish administration based on 2019 data and will be revised in the following reporting cycle once their new industry survey results are released.
In the 2016 edition, the Danish administration revised electricity and heat consumption in the industry sector from 1990.

*Transmission and distribution losses of electricity* are calculated as a residual.

The direct use of solar thermal energy is available from 1978.

Electricity consumption in *non-specified industry* includes consumption in district heating plants and for the distribution of electricity.
Estonia

Source

General notes

Data for Estonia are available starting in 1990. Prior to that, they are included in Former Soviet Union.

Coal

General notes

Fuels reported as coke oven gas and gas works gas are the gaseous by-products of oil shale liquefaction. Shale oil production has two technologies: solid heat carrier (SHC) and gas generators (GG). SHC output byproduct (in addition to oil shale) is semi-coke oven gas, which is categorized under coke oven gas. The GG byproducts (in addition to oil shale, fenols) are generator gas, which is categorized under gas work gas and semi-coke, which is categorized under coke oven coke. Inputs of oil shale to “coal liquefaction plants” are the inputs for retorting in liquefaction plants. These definitions and classification were applied to all the time series, back to 1990, in the 2024 edition.

In the 2024 edition, the Estonian administration revised oil shale inputs in the transformation sector since 1990. Thanks to these revisions, the IEA Secretariat is now reporting an aggregated input to Coal liquefaction plants (Transformation) instead of a breakdown between Coke ovens, Gas works and Coal liquefaction plants as was done in previous editions.

In the 2023 edition, the IEA Secretariat has further aligned the reporting of calorific values of oil shale to the figures provided by the Estonian administration. This led to revisions in energy terms of production and demand flows for 2019 and 2020 and of all types of electricity and heat producers but main activity electricity plants from 1990 onwards.

In the 2023 edition, the Estonian administration revised peat production, stock changes and consumption in main activity producer heat for 2020 due to new available information.
In 2019, the production and consumption of oil shale decreased significantly. This was due to two factors: CO2 and Russian electricity prices made the power generation from this fuel less accessible to the market; and at the same time Estonia was developing a strategy to reduce the direct burning of oil shale into electricity.

In the 2013 edition, data for oil shale production for the period 1991 to 1997 were revised to match Estonian GHG National Inventory values. Consumption data remained unchanged.

Supply

Oil

General notes
In the 2024 edition, fuel oil inputs to main activity heat plants in 2022 include fuel oil produced from oil shale.

In the 2021 edition, the Estonian administration submitted some revisions for residential consumption data and corrections in the historical time series. This affects gas/diesel oil, in particular.

In 2012 data, breaks in time series occur for trade figures, now including re-exports, and for international bunkers.

For 1990 to 2007, oil data are based on direct communication with Statistics Estonia and UNECE.

Natural gas

Consumption
Consumption reported under not elsewhere specified (Energy) represents consumption of different activities of companies in the energy sector (NACE 35) for own uses without transformation.

There are inconsistencies in the time series for residential consumption as this sector is computed as a residual.

In 2014 Estonia’s main company in the chemical and petrochemical sector ceased activity, resulting in no non-energy use of natural gas.
In 2009 Estonia's main producer of fertilisers ceased activity, resulting in a sharp decrease in the non-energy use of natural gas. The plant reopened in 2012.

Biofuels and waste

General notes
In the 2021 edition, revisions were made in main activity producers burning municipal wastes from 2015 to 2018.

In the 2021 edition, revisions were made in electricity plants burning solid biofuels in 2017 and 2018.

In the 2021 edition, revisions were made in main activity producers burning industrial waste (non-renewable) from 2016 to 2018.

In the 2021 edition, there were revisions in the non-metallic minerals sector from 2015 to 2018 for industrial waste (non-renewable) and municipal wastes.

In the 2021 edition, there was a revision in the wood and wood products sector for primary solid biofuels (excluding charcoal) in 2017.

Data for biogases include landfill gas starting in 2005.

Electricity and heat

General notes
In the 2022 edition, the Estonian Administration revised historical data, in particular, for oil shale, coke oven gas, and gas works gas, in order to better align data with that reported by companies under the EU Emissions Trading System (ETS).

Transformation
In 2019, electricity output from oil shale decreased. This was in part due to higher carbon pricing, and the availability of low cost electricity imports.

In the 2020 and 2021 editions, reporting methodologies were aligned with the requirements for physical energy flow accounts (PEFA). As a result, some breaks in series occur between 2015 and 2016. In particular, for renewable municipal waste, coke oven gas, and industrial waste.

Electricity output from solar is available from 2016.
Fuels reported as **coke oven coke** and **gas works gas** are the solid and gaseous by-products of **oil shale** liquefaction, and main activity heat and electricity generation from these fuels is tightly associated with liquefaction plants.

Inputs of **fuel oil** and **gas works gas** to transformation processes include **shale oil**.

In the 2018 edition, the surge in main activity heat from **solid biofuels** was related to reclassification from autoproducer heat plants, where previously autoproducer own use heat and associated fuel inputs are not reported, and the fuel consumption appears in the main economic activity of the autoproducer.

From 1990 to 1999, some of the **electricity** and **heat** production are reported under **other oil products** while the inputs are reported under the individual fuels.

**Consumption**

From 2021 onwards, **electricity** consumption previously reported under **Transport (non-specified)** is reported **Commercial and public services**.

**Electricity** consumption in the **non-specified energy** sector includes consumption in the Classification of the Economic Activities in the European Community (NACE) 3512 and 3513 categories.

**Electricity** consumption in **road** mainly refers to trolley buses.

**Trade**

For electricity, trade data are reported on the basis of commercial transactions. Therefore, data may not reflect actual physical exchanges, or include all trade partners. The Estonian Administration hopes to revise these data in a coming cycle.
Finland

Source

Statistics Finland, Helsinki.

General notes

In 2014, a new survey system and a reclassification of the data lead to breaks in the time series between 1999 and 2000 for most products and sectors. The new survey system is more detailed and has better product coverage, especially in electricity, CHP and heat production, as well as in industry.

Coal

General notes

Other recovered gases refer to the gaseous by-products of the ferrochrome production process.

Coal tar used for non-energy purposes or exported is not reported in either production or consumption.

In the 2015 edition, revisions were received for some consumption flows of other bituminous coal and coke oven coke, while other recovered gases (from ferrochromium manufacture) were reported separately for the first time, with revisions back to 2000. Prior to 2000, off-gases from ferrochromium manufacture are included in blast furnace gas, and inputs of coke oven coke for ferrochromium manufacture in inputs to blast furnaces instead of non-specified transformation.

Prior to 2008, peat products are included with peat data.

A large increase of steam coal imports in 2003 is related to a drought in Scandinavia. Thermal power plants were operated more intensively to replace hydro-generated electricity that is consumed in the country. Additionally, more coal-generated electricity was exported to other countries in the region.

The increase of other bituminous coal inputs into main activity producer electricity plants from 1993 to 1994 was due to coal replacing imported electricity and hydro power.

Production of gas works gas ceased in April 1994.

Hard coal data prior to 1978 may include sub-bituminous coal.
Supply

**Peat products** refer to peat briquettes and pellets, which were supplied from old stocks for 2019 and 2020.

Transformation

In the 2023 edition, **anthracite** consumption was reallocated from “Not elsewhere specified (Transformation)” to final consumption in iron and steel industry from 2013 to 2017 according to IRES guidelines on the reporting of coal products used as reductants (mostly for the manufacture of iron and steel).

The consumption of **other bituminous coal** in the energy sector (own use in electricity, CHP and heat plants) covers the use of coal in the pilot phase of a new power plant (the amount of coal was not used for producing any useful heat or electricity).

In 2017, the consumption of coal in main activity producer electricity plants decreased considerably following the move of a large plant to the national capacity reserve.

The significant increases and decreases of **other bituminous coal** inputs into main activity producer electricity plants from year to year are due to coal replacing imported electricity and hydro power.

Likewise, **peat** production is highly dependent upon favourable weather conditions and the pricing of other fuels. The decrease in **peat** and **other bituminous coal** usage in main activity electricity plants in 2008 was due to record electricity generation from hydro plants. A similar circumstance occurred in 2012.

The first coking plant started operation in 1987, hence imports of **coking coal** and production of **coke oven coke** and **coke oven gas** started in that year.

Consumption

In the 2023 edition, the Finnish administration introduced the reporting of blast furnace gas in “Not elsewhere specified (Energy industry own use)” from 2015. This quantity covers the amount of blast furnace gas used to support the energy consumption of the preparation process of the PCI-coal injection.

Some consumption of **other bituminous coal** is reported for the first time in 2019 as energy industry own use. This covers the use of coal in the pilot phase of a new
power plant (the amount of coal was not used for producing any useful heat or electricity).

Food, tobacco and beverages reports 1kt consumption of coke oven coke in 2019 after zero in 2018. This is due to rounding (2018: 0,46 kt and 2019: 0,72 kt).

Oil

General notes
In the 2023 edition, the Finnish administration revised the output and refinery fuel use of refinery gas from 2007 onwards to exclude gas by-products.

The 2018 edition includes revisions to data for several products from 1999 onwards.

Several revisions to petrochemical data were introduced, including a reclassification of quantities between energy and non-energy use. Further revisions are pending.

In spring 2015, the Porvoo refinery had the largest shut down in its history for maintenance works. This is the reason for the large decrease in refinery throughput in 2015.

In 2014, the Finnish administration revised the time series for refinery gas from 2000 and included flaring of petrochemical gases under distribution losses.

Prior to 2002, petroleum coke used as refinery fuel was included with refinery gas.

In 1995, there is a break in time series for oil products trade due to the aligning of the National Board of Customs trade data collection system with the European Union’s Intrastat system.

Other hydrocarbons reported under from other sources natural gas correspond to hydrogen used in refineries, also represented as the output of non-specified transformation in the balances format.

Supply
In 2021, refinery output declined due to a 12-week refinery maintenance outage.
Consumption

In the 2023 edition, the Finnish administration acquired more accurate information and revised the gas/diesel consumption in the agriculture/forestry from 2010 onwards. This also affected figures in not elsewhere specified (industry) sector as the previously unknown quantities of agricultural consumption were partly allocated to this sector.

Data on non-energy transformation of naphtha in the petrochemical sector is now available from 1990 onwards.

Due to a new calculation model, there is a break in fuel oil other consumption between 1998 and 1999.

Natural gas

General notes

Finland imports LNG since September 2016. Before 2018 there was only one company operating in this market, LNG supply data was thus confidential and excluded from the supply side flows.

Between 1999 and 2000 there are some breaks in the time series due to a new survey system and a reclassification of the data.

Supply

Data for international marine bunkers consumption started being reported in 2017.

The opening and closing stock levels data are confidential and stock changes data for 2017 are estimates by the Finnish administration. Transformation

Non-specified transformation data represent natural gas used for hydrogen manufacture. This hydrogen is used for hydrodesulphurization and hydrocracking in oil refineries

Consumption

In the 2023 edition, an update to methodology related to the hydrogenation process in refineries resulted in revisions to not elsewhere specified (transformation), oil refineries, and distribution losses back to 2007.

In the 2023 edition, revisions were made to chemical and petrochemical and agriculture/forestry back to 2015.
Distribution losses include the quantities of boil-off natural gas originating from the natural evaporation of LNG in tanks.

Not elsewhere specified (transport) includes LNG consumption for domestic navigation.

Since 1995 data, the breakdown between residential and commercial/public services is available due to a new system of data collection.

Prior to 1989, natural gas consumption in residential and agriculture/forestry had been estimated by the Finnish administration.

### Biofuels and waste

#### General notes

In 2023 edition, solid biofuels trade methodology was revised. The administration reported that the new estimation method was developed in cooperation with the Natural Resources Institute Finland (Luke) and that was not possible to revise the time series before 2018. Therefore, data breaks might appear between 2017 and 2018.

Prior to 2004, industrial waste also included other energy forms such as hydrogen, heat from chemical processes, natural gas and blast furnace gas.

Data for biogases and industrial waste are available from 1996.

#### Supply

Due to confidentiality, the biodiesel production includes trade figures and stock changes starting with 2015 data. Biogasoline import for the same time period covers production, exports and stock changes.

In the 2024 edition, for the first time imports of liquified biomethane have been reported, for 2022.

In the 2022 final edition, the administration changed the methodology to estimate primary solid biofuels trade data for 2021p. For this reason, a break in the time series appears between 2020 and 2021p. In future editions, the administration will revise historical data.

#### Transformation

The use of charcoal in blast furnaces started in 2018 on a test basis.
The amount of biodiesel used for blending with diesel fell greatly in 2016 after record levels for the past two years. Annual variation in the consumption of biofuels is possible and caused by Finland’s biofuel legislation, which gives distributors the possibility to fulfil the bio obligation flexibly in advance.

Consumption

In the 2024 edition, the increase of industrial waste consumption in commercial and public services for 2022 is due to the use of plastic waste as fuel for a new plant.

In 2023 edition, a plant consuming industrial waste and municipal waste were reclassified from "Not elsewhere specified" to "Commercial and Public Services" for the entire time series starting in 2000 and 2008, respectively.

Starting in 2017, the large increase of biogas consumption in the paper, pulp and printing industry is due to a change in process in the industry. Wood was gasified and replaced natural gas or oil.

Electricity and heat

Supply

For the 2023 edition, heat production by autoproducers in NACE divisions 36-38 was reallocated from Industry (non-specified) to Commercial and public services.

Electricity production in Finland is affected by connection to the Nord Pool power exchange. In periods of high rainfall, it is more economic to import electricity from other Nordic countries than to produce it. Therefore, production and trade are subject to variability.

Net and gross heat production are equal, no own use is reported. Heat production in Finland is reported as net.

Other sources include hydrogen, purchased steam, and heat recovered from flue gas scrubbers. For 2017, the increase in heat production from other sources is due to the reporting of heat recovered from flue gas scrubbers for the first time.

The increasing heat production from heat pumps in 2007 and 2008 is from the new Katri Vala district heating and cooling plant.

Heat from chemical processes and associated electricity generation are available from 2000.
Transformation

In 2022, refinery gas input to main activity heat plants was partially replaced by fuel gas produced from Naphtha and LPG.

For 2020 onwards, data for plants containing at least one CHP unit have been reported under CHP. Prior to 2020, electricity plants data may include some CHP plants operating in electricity only mode, and heat plants data may include some CHP plants operating in heat-only mode.

In the 2017 edition, fuel inputs and heat production from peat main activity heat plants have been revised since 2000 as new data became available for small peat heat plant units.

In the 2016 edition, the allocation of solar photovoltaic between main activity and autoproducer plants was revised.

From 2014 data, an autoproducer in the field of iron and steel industry running on coke oven gases and blast furnace gases was sold and is now reported as main-activity producer.

The increase in heat production from municipal waste in 2014 is due to the opening of a new plant.

In 2014, the new consumption of other liquid biofuels in main activity electricity plant corresponds to biopyrolysis oil made from wood chips.

Data on peat products electricity and heat generation are available since 2008. Prior to that, they are included in peat.

Heat output from autoproducer CHP plants is available starting in 1996 and from autoproducer heat plants starting in 2000; corresponding inputs may be under-reported.

Before 1999, all electricity production from autoproducers running on fuelwood is allocated to CHP plants.

Electricity and heat production from biogases are available from 1996.

Prior to 1992, outputs from the use of combustible renewables and waste to generate electricity and/or heat were included in peat. Therefore, the IEA Secretariat estimated the breakdown of outputs from municipal waste and solid biofuels based on reported inputs.
Inputs of **liquid fuels** and **natural gas** to CHP plants are included with the inputs of these fuels to main activity producer electricity only and heat only plants prior to 1978.

Electricity production from **biofuels and waste** is not available between 1974 and 1976.

**Consumption**

Electricity consumption in **road** is based on estimates by the Finnish VTT research centre, and includes all electricity consumption by electric vehicles, both 100% electric vehicles and plug-in hybrids.

In the 2017 edition and following, an extended review of NACE sector encoding by the Finnish administration resulted in the revision of the sectoral **heat** consumption time series back to 2007, leading to breaks in time series between 2006 and 2007 in some heat consumption sectors.

In 2016, the production of **heat** by autoproducers in the **oil refineries** sector ceased, following a change of ownership of some plants and their reclassification as main activity producers. This reclassification also resulted in an increase in reported heat consumption by oil refineries, as heat previously produced and consumed by **oil refineries** is now purchased.

Between 2013 and 2014, **heat** consumption in the **paper, pulp and printing** sector shows an apparent decline because a power plant came under the ownership of a paper and pulp company.

A new survey of the **agriculture and forestry** sector leads to breaks in the **electricity** consumption between 2007 and 2008.

The split of **heat** consumption in the different industry sectors is available starting from 2007. Prior to that, it is aggregated in **non-specified industry**.

Prior to 2000, consumption of **heat** in consumption in **agriculture/forestry** and **commercial/public services** is included under **industry non-specified**.

Consumption of **electricity** in the industry sub-sector **machinery** includes consumption in **transport equipment** prior to 1995.
France

Source

Ministère de la Transition Écologique et Solidaire, Paris.

General notes

In the 2018 edition, data for France were revised back to 2011 following changes in methodology and procedures used by the energy statistics sub-department (SDSE) within the Ministry for the ecological and inclusive transition. As a result, the revisions, to bring the reporting more in line with the international standards, impacted all fuels. Additional details are given under each fuel.

From 2012, the energy consumption is more detailed due to a more precise national survey.

From 2011 data onwards, France now includes Monaco, and the following overseas departments (Guadeloupe; French Guiana; Martinique; Mayotte; and Réunion); and excludes the overseas collectivities (New Caledonia; French Polynesia; Saint Barthélemy; Saint Martin; Saint Pierre and Miquelon; and Wallis and Futuna).

Coal

General notes

In the 2023 edition, due to confidentiality reasons the balance of coking coal has been merged with other bituminous coal for the year 2021. In particular, consumption of coking coal in coke ovens (transformation) is reported in other bituminous coal consumption in blast furnaces (transformation).

Due to confidentiality reasons, some demand flows have been merged for the products other bituminous coal and anthracite, starting in 2020. Those aggregations are: paper, pulp and printing, food, beverage and tobacco, and not elsewhere specified (industry); machinery, non-ferrous metals and non-metallic minerals.

Due to confidentiality reasons, some demand flows have been merged for the products lignite and BKB, starting in 2020. The flows merged are iron & steel, chemical and petrochemical, non-ferrous metals and non-metallic minerals.
Due to confidentiality reasons, the industry consumption flows of iron and steel, chemical and petrochemical and non-ferrous metals have been merged for coke oven coke, starting in 2020.

Due to confidentiality reasons, blast furnace gas includes blast furnaces gas, coke oven gas and other recovered gases from 2018 onwards. This aggregation may lead to unusual figures and efficiencies in the energy balance and CO2 emissions.

The losses of blast furnace gas, coke oven gas and other recovered gases are included under statistical difference until 2016. From 2017 onwards these losses are reported under “other energy uses”.

In 2018 edition, the calorific value of coking coal has been revised in agreement with Eurostat and the IEA. The revision was made for the period 1990 to 2016.

In the 2017 edition, the French administration undertook comprehensive revisions on sectoral coal consumption back to 2011. Starting this edition, new information became available for anthracite, BKB and other recovered gases.

From 2012, the energy consumption is more detailed due to a more precise national survey.

Prior to 2011, other manufactured gases (oxygen steel furnace gas) are included in blast furnace gas.

For 1989 to 1998, the IEA Secretariat has estimated industry consumption based on Consommations d’Energie dans l’Industrie, SESSI.

Prior to 1985, consumption of colliery gas is included with the use of coke oven gas by autoproducers.

Hard coal data prior to 1978 may include sub-bituminous coal.

**Supply**

In the 2023 edition, for the year 2021 and preliminary 2022 data the production of coke oven coke has been merged with stock changes for confidentiality reasons.

**Transformation**

In the 2021 edition, revisions were made on the split of other bituminous coal between Main Activity Producer Electricity Plants and Main Activity Producer CHP Plants for the period 2011-2018.
In the 2021 edition, following a methodological change, a power plant was reallocated from main activity producer to autoproducer. Hence, there is no more figure for other manufactured gases in the first. This was done for 2018 and 2019.

In 2017 the use of other bituminous coal into transformation for electricity increased by more than 20% to compensate lower generation from nuclear and hydro plants.

In 2016 the company that consumed blast furnace gas for electricity and heat generation ceased its activity.

Consumption

In the 2018 edition, the split of energy consumption between the residential sector and the commerce and public services sector has been revised back to 1990 by the French administration for other bituminous coal, lignite, coke oven coke, BKB and patent fuel.

Blast furnace gas and coke oven gas used for energy purposes in blast furnaces are no longer reported under the iron and steel industry. As of the 2018 edition these quantities are reported under the energy sector.

Final consumption in industry is estimated by the Secretariat from 1986 to 2001 for some products.

Oil

General notes

In the 2024 edition, the French administration revised supply and consumption of gas/diesel oil from 2011 onwards.

In the 2021 edition, the French administration revised the deliveries of gas/diesel oil and fuel oil for international marine bunkers and consumption in domestic navigation from 2011 onwards as a result of a change in methodology and improved data for the overseas territories.

Statistical differences observed for motor gasoline and naphtha are partly due to the absence of a specific naphtha category in the customs classification.

Statistical differences appear for other products as a result of different definitions used for this residual category between the customs, refineries, power plants and petrochemical industry.
From 2013, information is available for imports of condensates used by the petrochemical sector. These are reported under imports of NGL, interproduct transfers of NGL to other oil products, and consumption of other products.

From 1991, additives and oxygenates data are available.

Supply

The high statistical difference for fuel oil is under investigation by the French administration and revisions are expected next cycle.

In the 2024 edition, the French administration started reporting supply and deliveries of bio jet kerosene.

Due to classification issues noted by the French administration, there is a large statistical difference for other kerosene in 2020.

Breaks in trade and transfers of refinery feedstocks, naphtha, gas/diesel oil and fuel oil occur in 2020 due to new reallocation following customs information obtained by the French administration.

The decrease in output of naphtha in 2019 is due to refinery maintenance shutdowns, particularly of the Grandpuits refinery with the drilling of the Ile-de-France pipeline (PLIF).

Higher than usual seasonal maintenance in the spring of 2018 impacted refinery intake and output.

From 2009, transfers of kerosene type jet fuel to white spirit correspond to kerosene used as a base for making white spirit.

From 2008 data, refinery intake of refinery feedstock and refinery output of refinery gas output figures exclude natural gas used in the steam reformer of the Gonfreville refinery.

From 2008 data, ethane refinery output is reported.

From 2002 data onwards, ethylene produced in Lacq is not included in NGL.

From 1998 data, a different treatment of transfers was adopted. Imported oil products needing further refinery processing are no longer reported as refinery feedstock imports but as oil product imports and products transferred. Fuel oil includes part of the amounts previously reported in other oil products from 1999 and various other products from 2001.
Transformation

Starting in 2012, separate data on main activity heat plants inputs are available.

Consumption

In the 2023 edition, the French administration reallocated the consumption of petroleum coke in non-ferrous metals from energy use to non-energy use from 2011 onwards. There is no change to total inland demand as a result.

In the 2021 edition, the French administration revised the consumption split of kerosene type jet fuel between international and domestic aviation from 2011 onwards, taking into account non-commercial flights and resulting in an increase in the consumption share for domestic aviation.

From 2018, due to a reclassification of a power plant from the main electricity production sector to the chemicals sector, a decrease in inputs of refinery gas for main activity plants for CHP production is observed and complemented by an increase in its consumption for energy use in the chemical sector.

From 2018, consumption of gas/diesel oil in bakeries is reported in food, beverage and tobacco. In previous years, this consumption is included in commercial and public services.

In 2018, there is a decrease in deliveries to the petrochemical sector due to plant shutdowns for maintenance.

The breakdown between international and domestic marine bunkers is estimated by the French administration.

Between 2005 and 2006, a break is visible in LPG time series, as consumption from one chemical company was re-classified from energy use to non-energy use. Breaks in LPG time series also appear in 2001 due to improved data collection.

From 2000 data, petroleum coke consumption in the non-ferrous metals industry is no longer available separately. Prior to 1982, no breakdown between energy and non-energy use is available for this product.

From 1998 data, military consumption of kerosene type jet fuel is reported separately from domestic aviation.

Prior to 1988, LPG includes ethane consumption.

Prior to 1985, the residential sector consumption of gas/diesel oil is reported under the commerce/public services sector, as no separate data were available.
Natural gas

General notes
Between 2017 and 2018, there are some breaks in the time series throughout consumption due to a new methodology for preparing the natural gas balances. Until 2007, some statistical differences reported by the French utilities were included in distribution losses. Since 2008, these amounts are included under statistical differences.

Between 1999 and 2000, there are some breaks in time series due to a new methodology for preparing the natural gas balances.

The data include the French overseas departments, however natural gas is neither produced, nor consumed in these departments.

Supply
The total imports and exports data include transit amounts.

From 1990 to 1998, statistical difference includes gas consumption which is not broken down by sector.

Consumption
Not elsewhere specified (transport) is consumption for maritime transport, prior to 2018 this data were included in commercial and public services.

In the 2020 edition, commercial and public services, and residential was revised from 1990 to 1999 due to new data becoming available.

The increase in natural gas consumption in the electricity sector for 2016 and 2017 has been mainly driven by the decrease in nuclear generation due to maintenance operations, which was compensated by gas-fired power plants. Gas for pipelines is included in distribution losses.

Between 2005 and 2006, there is a break in the time series of the industry sub-sectors.
Biofuels and waste

General notes

In the 2018 edition, following an analysis of biogases in the energy sector by the French administration, there are revisions in biogas indigenous production, inputs to the transformation sector, heat production and final consumption back to 2005. Electricity production from biogases is revised back to 2011. This causes breaks in time series between 2004 and 2005 as well as 2010 and 2011.

Indigenous production, transformation and final consumption of industrial waste are reported from 2013. In the 2018 edition, indigenous production and transformation of industrial waste were added from 2007 - 2012. It follows that there is a break in time series between 2012 and 2013.

In the 2018 edition, solid biofuels’ indigenous production and inputs to main activity and autoproducer heat plants have been revised back to 2007. Electricity production has been revised back to 2013. This causes breaks in time series between 2006 and 2007 as well as 2012 and 2013.

In the 2018 edition, indigenous production and inputs to main activity heat plants have been revised back to 2007 for municipal waste. Electricity production has been revised back to 2011. This causes breaks in time series between 2006 and 2007 as well as 2010 and 2011.

Prior to 2007, production and consumption of industrial waste were included in municipal waste.

Transformation

Plants using municipal waste were reclassified as autoproducer CHP plants from 1995, which leads to a break in time series.

Breaks in time series in 2005 for municipal waste and solid biofuels are caused by sectoral reclassifications.

Consumption

A revision of the solid biofuels and biogases time series created breaks in the direct use time series between 2004 and 2005.

The breakdown of the final energy consumption of biogases was estimated by the French administration from 1970 to 2003.
Electricity and heat

Supply
In the 2019 edition, heat supply and consumption data were revised due to improved information on heat production from renewables.

All solar photovoltaic plants with capacity above 1 MWp are considered as main activity producers, while all plants with capacity below that value are considered autoproducers.

Electricity production from other sources is available starting in 2007, representing production of electricity from purchased steam, and from 2018, hydrogen. The input is shown under non-specified transformation.

Data on electricity production from wind are available from 1990.

Transformation
In the 2021 edition, some main activity producers were reclassified as autoproducers.

For 2018, inputs and outputs of coke oven gas, and other recovered gases are included under blast furnace gas for confidentially purposes.

The methodology for reporting inputs to CHP plants is under currently under review by the French administration and historical revisions are expected.

For the 2018 edition, revisions for heat production in all plant types were received and accepted for many fuels from 2007 onwards, with the exception of natural gas, where the planned revisions for 2007 and 2008 are still pending implementation by the Secretariat.

In the 2018 edition, electricity production from hydro was revised back to the year 2000, in some cases only amounting to plant reclassification.

Electricity production from the Bouillante geothermal main electricity plant in Guadeloupe is included from 2011 onwards, when data coverage for France is extended to include the overseas departments. Electricity production from autoproducer geothermal started in 2011 and stopped in 2012 due to the maintenance of the only plant. This production restarted in 2016.

The amount of heat not sold in autoproducer plants is included in total heat production up to 2007.
In 2005, autoproducer CHP efficiencies for **biogases** drop due to the opening of a larger, less efficient plant.

From 2000 several plants have been reclassified from electricity only to CHP plants. This causes breaks in the time series between 1999 and 2000.

Prior to 2000, inputs and outputs of **oil products** are not available separately and are reported together under **other oil products**. From 2000 to 2008, there are further classification problems for inputs and outputs of electricity and heat from oil products. The French administration is working to reconcile their data collection methods for the inputs and the outputs for electricity generation.

A new method of survey and a reclassification between main activity producer electricity plants and autoproducer electricity plants may cause breaks in the time series for **other bituminous coal** between 1998 and 1999.

There was re-classification on autoproducer plants using **municipal waste** in 1995, which leads to a break in the time series.

Net electricity production by autoproducer CHP plants is available from 1989.

Net **electricity** production by autoproducers prior to 1983 includes production from combustible fuel sources only.

**Consumption**

In the 2021 edition, data were revised back to 2011 by the French administration to replace data from statistical surveys with new administrative data.

In the 2019 edition, revisions for 2011 onwards were received for all **electricity** consumption flows, based on a correction to a survey. This has introduced a wider statistical difference than previously published, and is under review.

In the 2018 edition, revisions for 2011 onwards were received for all **electricity** consumption flows, based on an improved survey. This has led to breaks in time series between 2010 and 2011. Similarly, **heat** consumption from 2007 onwards was revised to account for autoproducer own use heat generation in its correct economic activity.

In the 2017 edition, the French administration undertook comprehensive revisions on sectoral **electricity** consumption time series, for some sectors revising back to 1990. Electricity consumption at railway and bus stations, shipping piers and airports is no longer included in the **transport** sector but in the **commercial and public services** sector. **Road** electricity consumption has also been revised back
to 1990, following an extended review of NACE sector encoding by the administration. These revisions created breaks in time series for several sectors, which the administration anticipates to address in subsequent reporting cycles.

For the 2014 edition of this publication, the French administration revised electricity consumption data in the agriculture and forestry sector back to 2004, resulting in breaks in time series.

Electricity consumption in Road includes consumption by 100% electric vehicles. These amounts are estimated by the French Administration based on vehicle numbers, and expected electricity usage. Consumption includes domestic charging - however, these amounts are currently subtracted from non-specified transport, rather than residential consumption.

Consumption of electricity in uranium treatment plants is confidential for the period 2003 through 2010, and unavailable prior to 1980.

Data on transmission and distribution losses for heat are available only starting from 2007. Prior to that, they were included in final consumption.

Prior to 2005, all the geothermal heat consumption was reported as direct use. From 2005 data, some quantities are reported as output of heat plants, resulting in breaks in time series for production, transformation and consumption.

Electricity consumption in non-specified transport refers to ski lifts.

Prior to 2011, electricity consumption in (sub)-urban and national rail is based on high voltage electricity supply to the rail sector. From 2011 onwards, consumption in (sub)-urban rail is based on electricity used for propulsion by the main operator, and estimates for the other operators.

Consumption of electricity for oil and gas extraction includes that used in oil refineries from 1988 to 2000.

Non-specified other consumption includes exports to Monaco prior to 1992 and defence-related activities, among others.

The industry classifications used by the French administration were changed in 1986.

There are major breaks in the time series in 1965 when more detailed breakdown of data on electricity consumption became available.
Germany

Source

General notes

Data starts in 1960. German data include the new federal states of Germany from 1970 onwards.

Coal

General notes

Comprehensive official data are only collected for the aggregate of hard coal. Due to the unavailability of detailed data, the split into anthracite, coking coal and other bituminous coal is partly estimated by the national administration. Generally, demand data for the latest reporting year are not available at the time of the initial data collection and are estimated by the German administration. Therefore, every cycle the German administration revises several flows in transformation, energy industry own use and final consumption, as it happened for 2020 figures in the 2023 edition.

In the 2014 edition, significant revisions were submitted for all primary coal types, derived products and manufactured gases for the period 2003 to 2011 as previous estimations were updated with more accurate information. Revisions primarily affected consumption, including industry and other sectors; but also supply, statistical differences and weighted calorific values.

Up to 2002, other bituminous coal includes anthracite.

Between 1998 and 2005, breaks in time series may occur for coke oven gas and blast furnace gas.

Between 1990 and 1992, breaks in time series may occur due to earlier reclassification of several sectors by the German administration; this particularly affects BKB, lignite and coke oven coke.
Supply

Hard coal mining in Germany ceased in 2018 with the last two hard coal mines being closed on December 21, 2018 due to profitability reasons. Anthracite, coking coal and other bituminous coal show null production in 2019.

Data on stock changes in the coal production sector (provided individually for all coal products) are no longer available from 2019 onwards as the companies in this sector no longer operate. For the other sectors (electricity and heat producers, and industry), data on stock changes are only available for hard coal as an aggregate, and that is all reported under other bituminous coal.

Transformation

Breaks in time series between 2014 and 2015 for coke oven gas and blast furnace gas are due to a reclassification of main activity producers and autoproducers.

In 1997, BKB inputs to gas works plants stopped.

For some years of the period 1990-2002, discrepancies can appear between the publications Coal Information and Electricity Information in Electricity and CHP plants for the products lignite, gas works gas, coke oven gas and blast furnace gas.

Consumption

Consumption of non-renewable municipal waste and other solid biofuels as a reductant occurs in German blast furnaces, but is not currently quantified. Likewise, coal tar is a by-product of coke ovens, but not currently reported.

The data providers for the commercial and residential sectors were coal producers and import statistics, the first reporting the biggest amounts. As the hard coal production ceased in Germany, coal producer do not longer operate, and this data is not available from 2019. As consequence, the year 2019 shows a significant decrease in consumption in these sectors. In 2019, there was no increase in the imports delivered to these sectors.

Oil

General notes

In 2018, decreases in refinery intake and deliveries to the market can be attributed to the temporary shutdown of two high-capacity refineries.
In 2018, there are breaks in time series for several products due to methodological changes involving the inclusion of companies with olefin plants into the reporting group and the possibility to identify semi-finished products as deliveries to the market.

In 2017, the German administration included additional firms in the chemical sector to their data collection system. As a result, for 2017 data there is an increase in deliveries of oil products to the petrochemical sector.

In 2016 the German administration reclassified the consumption of a chemical company from fuel oil to other oil products. This leads to a decrease in the supply and consumption of fuel oil with a corresponding increase for other oil products. Due to the assumptions made by the German administration about the energy consumption of the respective products, this also creates a break in time series in the split between energy and non-energy consumption for the chemical sector.

In 2016 there are breaks in time series for white spirit due to an increase in data coverage. Historical revisions are expected in the next edition.

From 2000 data, part of the product Andere Rückstände (other residues) is included with fuel oil instead of other oil products.

Starting from 1994 data, there has been a reclassification of jet gasoline to kerosene type jet fuel.

Prior to 1979 data, other products include paraffin waxes, bitumen, white spirit & SBP and lubricants for eastern Germany.

The methodology to determine net calorific values has been changed for 2015 data. The values for crude oil and refinery feedstocks were revised back to 2003.

**Transformation**

In 2018, owing to methodological changes, inputs of motor gasoline for transformation use in the petrochemical industry are reported for the first time.

**Consumption**

In 2018, owing to methodological changes, consumption data for motor gasoline in the chemical and petrochemical industry as well as in non-specified industry are reported for the first time.
In 2018, consumption data for **motor gasoline** and **gas/diesel oil** in **construction** and **agriculture/forestry** are reported where they had previously been subsumed within the **commercial and public services** sector.

Between 2002 and 2003, breaks in time series in consumption data are due to structural changes in energy statistics following the newly introduced Energy Statistics Act.

In 1995 data, a break in **gas/diesel oil** consumption occurs as a result of an alignment with the Classification of the Economic Activities in the European Community (NACE).

Beginning in 1994, final consumption by individual sector has been improved due to new survey methods instituted by the **Minerölwirtschaftsverband**.

In 1989, end-use consumption of **gas/diesel oil** decreased due to an exceptionally warm winter and a lowering of consumer stocks.

Prior to 1980 data, consumption of **fuel oil** in blast furnaces was included in the iron and steel sector.

Prior to 1970 data, consumption of **refinery gas** in the chemical industry is included with refineries' own consumption.

### Natural gas

**General notes**

Between 2009 and 2010, there is a break in time series due to a new, more comprehensive legal framework that resulted in methodological changes for production and new calorific values for **natural gas**.

**Supply**

Starting in 2016, due to a change in the reporting methodology, **Imports** and **Exports** no longer include transit volumes, as was the case up until 2015.

Since 2018 onwards, indigenous production is being phased out, leading to a decrease in **non-associated gas**.
Transformation

For 2021 data onwards, the methodology of reporting main activity producer CHP plants was updated to include biomethane that is injected into the natural gas grid.

In 2003, there is a break in time series for input to electricity and CHP plants (both autoproducers and main activity producers).

Prior to 1995, inputs of natural gas for main activity producer heat plants are included with main activity producer CHP plants.

Consumption

Between 2021 and 2022, there is a break in the time series for agriculture/forestry due to an adjustment to the methodology.

Since 2018, gas distribution networks are included in pipeline transport, while it was only covering transmission networks before.

Since 2003, consumption in non-specified other, which were previously estimated, are no longer shown, and losses data have been included in statistical differences.

Since 2003, gas consumption in coke ovens (transformation) was negligible.

Between 2002 and 2003, there are breaks in time series for some sectors due to modifications in reporting methodology.

Between 1994 and 1995, there are some breaks in time series due to the fact that the industry sub-sector breakdown is based on the 1995 NACE classification.

Also, prior to 1995, end-use consumption data are based on Arbeitsgemeinschaft Energiebilanzen.

Before 1970 there is no detailed breakdown available for the industry sector with the exception of iron and steel and chemical and petrochemical industries.

Biofuels and waste

General notes

Generally, data for the latest reporting year are preliminary and likely to be revised in the following publication. For example, this is the case of the many revisions for 2021 figures in the 2024 edition.
In the 2024 edition, the German administration submitted solar photovoltaic capacity according to the new categories PV<30 kW and PV 30-1000 kW only for the years 2021 and 2022, causing a break in the time series between 2020 and 2021. For the years before 2021 the data are likely to be revised in the next cycle.

Germany started to report injection of biogas in the natural gas grid in 2021 only. Previously, the biogas blended with natural gas was reported under biogas. For this reason, several energy flows dropped significantly in 2021.

In the 2020 edition, there was a revision of nearly all renewables data back to 2003, basically related to error correction and new information. This leads to a break in series between 2002 and 2003.

Starting with the 2020 edition, final consumption in the agriculture sector is now reported separately. Previously, it was included in commercial and public services.

Starting in 2008, municipal waste and industrial waste data were collected separately. This leads to breaks in the time series between 2007 and 2008.

Supply
Trade data for biogasoline are available from 2004 and for biodiesels from 2003.

Consumption
Increased consumption of industrial wastes (non-renewable) in the non-metallic minerals sector in 2018 is related to increased cement production due to a high level of activity in the construction sector.

For solid biofuels consumption in the commercial and public services sector, new data were derived in cooperation with the Federal Research Institute for Rural Areas, Forestry and Fisheries by applying a different calculation approach based on the total demand for material and energy use of the resource wood in Germany. This had resulted in break in time series between 2013 and 2014.

Electricity and heat

General notes
In the 2014 edition, the German administration performed some major revisions back to 2003. This led to breaks in the time series between 2002 and 2003.
The German administration has changed the methodology for reporting heat over time:

Starting in 2007, more information is available on main activity heat plants and additional inputs started to be reported for this category. This causes breaks in time series between 2006 and 2007.

Between 2003 and 2006, autoproducer heat output was provided, but no inputs.

Between 2002 and 2003 and between 2003 and 2004, breaks in time series occur, due to the implementation of the Energy Statistics Act, collection concerning heat produced in heat plants and district heating plants became more efficient and more complete.

Prior to 1970, heat production and consumption have been estimated by the Secretariat based on Energie-bilanz der Bundesrepublic für das Jahr 1990 provided by the German Institute for Economic Research.

**Supply**

From 2018 onwards, own use of electricity at main electricity geothermal plants includes electricity used for pumping.

In some instances, electricity generation from nuclear, hydro, solar, wind and biogases in autoproducer electricity plants is confidential or not available and therefore is included in main activity producer electricity plants.

For 2017 onwards, own-use consumption of electricity by wind plants is assumed to be 2% at onshore and 1.5% for off-shore wind farms. For prior years, own-use only included electricity drawn from the grid while the turbines were not in operation.

Since 2011, due to a reclassification of wind energy and solar photovoltaic in the official data of the German Federal Statistical Office, the production is now only reported under main activity producer plants.

Electricity production from other sources is available starting in 2003. This refers to the production of electricity from turbines which are located at pressure drops in fluid transport and from purchased waste heat.

Prior to 1991, electricity trade data includes only trade of the Former Federal Republic of Germany.

Data on electricity production from wind and solar are available from 1986 and 1990, respectively.
Starting in 1984, small amounts of heat have been exported to Denmark.

**Transformation**

For 2022, the decrease in electricity output from nuclear was due to the closure of the Grohnde, Gundremmingen C and Brokdorf power plants.

For 2018, the increase in electricity output from solar PV was in part due higher than average solar radiation during that year.

For 2018, the increase in heat output from biogases was mainly due to an increase in survey coverage following an amendment to the Energy Statistics Law in 2017

**Electricity** inputs to both mixed hydro and pure pumped storage pumping plants are reported under inputs to pure pumped storage.

Detailed data by fuel are not available for total heat production. The non-allocated part is reported as heat production from non-specified combustible fuels.

Weather conditions were not favourable for wind and solar generation in 2016.

In 2015, a reclassification of some main activity producer electricity and CHP plants to autoproducer CHP plants powered by coke oven gas results in a break in time series for this period. Similarly, a reclassification of blast furnace gas main activity electricity plants into autoproducer plants results in a break in time series for the same period.

From 2003 onwards, all heat production in autoproducers is considered as non-sold (i.e. for self-use) and, therefore, not reported. Inputs for this heat production are no longer reported in the transformation sector.

For 2002 and 2003, the German administration did not submit the breakdown of electricity and heat production from combustible fuels. The data were estimated as follows: renewables and waste were taken from the Renewables and Waste Questionnaire and the other combustible fuels were estimated pro rata based on 2001 estimates.

Prior to 2003, electricity production in electricity plants includes production from CHP plants and heat production in CHP plants includes production from heat plants.

Due to the implementation of the Energy Statistics Act, collection concerning heat produced in heat plants and district heating plants became more efficient and
more complete. This leads to breaks in time series between 2002 and 2003 and between 2003 and 2004.

A new survey for the renewable products can cause breaks in the time series between 1998 and 1999.

Prior to 1993, all heat production from BKB/peat briquettes is included in main activity producer CHP plants.

**Consumption**

Increases in 2016 electricity generation by auto-producers within the transport equipment sector are due to reclassification from main activity generation, rather than development of new plant.

More information on district heat became available, causing breaks in the time series between 2006 and 2007.

Data on geothermal heat production and direct consumption are only available starting in 2003.

Data for electricity consumption in the commercial and public services sector include the construction and agriculture/forestry sectors (prior to 2010), as well as the fishing sector (all years).

In 2000, revisions from the German administration to the electricity consumption data may cause breaks in the time series.

In 1995, the German Federal Statistics Office reclassified some industrial branches which may cause a break in time series in industry sub-sectors.

Between 1971 and 1980 electricity consumption in coal mines includes consumption in coke ovens and BKB plants.
Greece

Source

Ministry for Environment and Energy, Athens.

Coal

Supply

In 2019 data there was a significant decrease in lignite production and consumption due to less power generation in the country using this fuel.

Consumption

In the 2023 edition, the Greek administration reallocated the industrial consumption of other bituminous coal and lignite in non-metallic minerals sector to mining and quarrying from 2017 to 2020, due to the change of a NACE code of a company.

Oil

General notes

In the 2016 edition, the Greek administration reclassified gasoline-type jet fuel as aviation gasoline starting from 2009 data.

Between 2012 and 2013, breaks time in time series for biodiesel, lubricants and stocks appear due to the introduction of a new reporting system.

Supply

Crude oil production stopped on 30 November 1998 and started again in December 1999.

From 1986 data onwards, information on refinery feedstocks is available.

Transformation

From 1990 onwards, there has been an increased use of refinery gas in electricity generation, replacing fuel oil.
Consumption

In 2021, due to improvements by the Greek administration, the share of LPG consumption in Non-specified (industry) declined due to better allocation into the various specific sub-sectors within the industry.

In 2020, consumption of gas/diesel oil in electricity/CHP/heat plants (energy sector) refers to quantities used to support operations of a lignite plant. For previous years, they are reported in the transformation sector as inputs for CHP production in main activity plants.

In 2013 data, the drop of gas/diesel oil residential consumption is linked with changes in the taxation of heating oil.

From 1993 data onwards, more information is available on the allocation of fuel oil to specific industrial sub-sectors. Fuel oil consumption in the agriculture and residential sectors has been replaced by gas/diesel oil starting in 1993.

Prior to 1987 data, consumption in the commerce/public services sector is included with residential. Peaks in residential sector consumption in 1978 and 1982 are due to unusually cold winters.

Natural gas

General notes

Natural gas produced in Greece has a higher than average gross calorific value due to a high content of C₂/C₄ hydrocarbons.

In the 2020 edition, due to more disaggregated data and a revised methodology, years 2017 and 2018 are not comparable to time-series prior to this.

Supply

The significant increase of Total Exports in 2022 is due to the regasification and subsequent export of LNG Imports.

Stocks (Held abroad) refers to stocks of natural gas held in underground storage facilities in Italy and Bulgaria.

In November 1998 the indigenous production of natural gas stopped in and started again in December 1999.

In 1997, Greece started importing natural gas as a result of a new operational pipeline between Russia and Greece.
Consumption

Prior to 2017, consumption of liquefaction (LNG) / regasification plants is included in the transmission and distribution losses flow.

Between 2021 and 2020 there is a break in the time series for many flows in the industry sector due to more detailed data becoming available.

In 2011 there is a break in time series for the non-ferrous metals due to a new methodology for measuring gas consumption in this sub-sector.

For 1998 data, consumption in the residential sector is included with commercial/public services.

Biofuels and waste

General notes

New information on solid biofuels is available from 1996 and leads to breaks between 1995 and 1996.

Data for biogases are available from 1990 and data for industrial waste from 1992.

In 2024 edition, 2022 liquid biofuels data have been estimated by the IEA Secretariat.

Supply

Indigenous production and domestic supply of industrial waste have been estimated by the IEA Secretariat for 2019p.

Indigenous production of solid biofuels is estimated by the IEA Secretariat for 2015 based on consumption.

Transformation

The big increase in delivery of industrial waste to autoproducer CHP plant in 2010 is mainly due to the opening of a new plant.

Inputs of solid biofuels to charcoal production are estimated for 2007 to 2010 by the IEA Secretariat assuming an efficiency of 40%.

Industrial waste used in autoproducer CHP plants decreased substantially in 2006 because a plant closed.
Consumption

Solid biofuels consumption in commercial/public services is included in residential until 2011.

The consumption of solid biofuels in the paper, pulp and printing industry is not available from 2003 to 2012.

Electricity and heat

Supply

In the 2020 edition, revisions for 1998 – 2017 of the indigenous production of solar thermal are the result of a revision of the latest data on solar thermal efficiency.

For 2016, gross electricity generation from combustible fuels in main activity electricity and autoproducer CHP units was estimated by the IEA Secretariat, based upon the gross to net ratio for combustible fuels for these plant types in 2015. This increase in production was assigned to lignite-fired and natural gas-fired plant.

Transformation

Prior to 2020, use of gas/diesel oil to support operations (rather than generate power) at lignite-fired Main CHP plant operations was reported as a transformation input.

Data on heat outputs from natural gas–fired Autoproducer CHP plants are available from 2020.

In 2008 a new plant using refinery gas started operating in an experimental phase, causing a low efficiency.

Production and consumption of distributed heat (heat sold) that is produced from lignite is available from 1997.

Data for biofuels and waste input and output to transformation are available from 1992.

Consumption

In 2018, breaks in consumption occur across several sectors due to improved disaggregation. This allowed consumption previously reported under industry (non-specified) to be reported in the appropriate subsectors.
In 2018, the increase in efficiency at industrial waste-fired autoproducer CHP plants was due to increased generation of unsold heat.

Prior to 2018, electricity consumption in the fishing sector was included in agriculture and forestry, and/or industry – non-specified.

Transmission and distribution losses of electricity increased from 2013 onwards due to growth in non-technical losses. Reported losses for 2017 deviate from this trend, showing a noticeable decline compared with adjacent year however, data for 2017 are under review.

Electricity consumption in road is available from 2013. This refers to consumption by public transport vehicles (e.g. trolley buses). Electricity consumption by private electric vehicles is insignificant and not included.

Direct use of geothermal heat in residential is available starting in 2004.

Electricity consumption in iron and steel and in the non-ferrous metals industry prior to 1971 has been estimated by the Secretariat.
Hungary

Source

Hungarian Energy and Public Utility Regulatory Authority, Budapest.

General notes

Data are available starting in 1965.

The Hungarian administration submitted questionnaires to the IEA Secretariat for the first time with 1993 data.

Coal

General notes

The main iron and steel company in Hungary has decreased its operations in 2022, leading to a drop in coking coal and coke oven coke use in transformation and in coke oven gas and blast furnace gas production and consumption.

In the 2023 edition, the IEA Secretariat has further aligned the reporting of calorific values to the figures provided by the Hungarian administration. This led to revisions in energy terms of main activity producer electricity and CHP plants for lignite and of BKB imports and industry consumption from 2017 to 2020.

In the 2020 edition, revisions back to 2014 were done for blast furnace gas to report separately the energy consumption for the support of blast furnaces. Previously, this consumption was reported as final consumption in the industry iron & steel.

From 1992, the production of sub-bituminous coal has been included with lignite due to the low quality of the coal. From 1990 to 1999, the use of this domestic coal in main activity producer electricity and CHP plants has also been reclassified to lignite. Since 2017, imports, transformation and consumption of sub-bituminous coal was reclassified as lignite by the Hungarian administration to align with foreign trade statistics.

Transformation

Some CHP units consuming blast furnace gas and coke oven gas were under maintenance in 2018.
In 2017, a main activity CHP plant using *other bituminous* coal was merged with an industrial unit of the pulp, paper and print sector and was since reclassified as an autoproducer.

Autoproducer heat and power plants using *coke oven gas* and *blast furnace gas* were reclassified in 1998 as main activity power plants.

**Consumption**

In the 2022 edition, revisions back to 2017 were made for the non-metallic minerals industry, by reallocating some quantities previously reported as *lignite* to *BKB*.

The cement industry in Hungary is progressively replacing the consumption of coal by waste. This situation is translated to a decreasing trend in consumption of other bituminous coal in the non-metallic minerals industry.

The consumption of coal tar in the category Non-Energy Use (petrochemical sector) increases in the year 2019. In previous years, CO2 quotes prevented companies of this sector from using more coal tar, but in 2019 they installed new CO2 filters, that enabled them to use more coal tar keeping CO2 emission on the same level.

**Oil**

**General notes**

From 2010, *from other sources - natural gas* of *other hydrocarbons* correspond to hydrogen used in refineries for hydrodesulphurization, also represented as the output of *non-specified transformation* in the balances format.

Starting from 1998, data for additives and aviation gasoline are available.

In the 2022 edition, *other oil products* include ethylene, toluene, sulphur and FCC residue from 2012 onwards.

From 1994 onwards, other products include aromatics and other products that were previously included mainly under white spirit. Prior to 1993, *white spirit* is included in motor gasoline. Data for *refinery gas*, *paraffin waxes* and *lubricants* are partly estimated by the Secretariat.
Supply
In 2020, changes in the national legislation mandated an increase in the minimum blending of biofuels.

Consumption
In the 2016 and 2017 editions, revisions to consumption data back to 2010 were provided by the Hungarian administration following a survey introduced in 2014. This results in breaks in time series between 2009 and 2010.

Natural gas

General notes
Since 2022, one CHP plant has been reclassified to an autoproducer electricity plant.

Between 2012 and 2013 there are some breaks in time series for the energy, transport and industry sectors consumption due to a new methodology. Historical revisions are pending.

Between 1996 and 1997 some breaks in time series exist due to a new methodology applied by the Hungarian administration.

Supply
In 2022, the value reported for stock change (cushion gas) in TJ is due to a technical reclassification.

Between 2015 and 2016 there is a break in the time series for Imports and Exports due to a new methodology which eliminates the reporting of transit trade.

Transformation
Since 2010, data reported for non-specified transformation represent natural gas used for hydrogen manufacture used in refineries for hydodesulphurization. Prior to this year, these quantities are reported under oil refineries.

Since 1997 two autoproducer heat plants have been reclassified to main activity producer heat plants.
Consumption

Beginning in 2016, electricity consumption under the non-specified other sector includes military usage, following recent clearance to disseminate these data.

Prior to 2004 iron and steel consumption includes transformation of natural gas in blast furnaces (transformation).

Biofuels and waste

General notes

Data for biogases are available from 2000; for industrial waste from 2003; for biodiesel production from 2007.

Supply

In the 2024 edition, the Foreign Trade Statistics improved the data coverage of primary solid biofuels imports and exports. That led to increased trade volumes for 2022.

A 2012 change in biogasoline reporting methodology results in break in time series between 2011 and 2012.

Consumption

In 2019, increased consumption in the non-metallic minerals sector for solid biofuels and municipal wastes is related to fuel switching from coal.

In the 2018 edition, the Hungarian administration has revised solid biofuels consumption in other sectors back to 2005 based on the new survey from Hungarian Central Statistical Office (HCSO). This resulted in break in time series between 2004 and 2005.

A new reporting methodology for the direct use of geothermal energy was applied from 2014 resulting in break in time series between 2013 and 2014.

Electricity and heat

Supply

For 2017 onwards, inputs and outputs from power plants are reported at a unit level, while for prior years, data are reported at a plant level. As a result, breaks in series are observed between 2016 and 2017. In particular, for electricity output
from main activity producer CHP and main activity producer nuclear power plants, and for heat output from industrial waste at autoproducer CHP and autoproducer heat plants.

In 2017, a main activity producer CHP plant was reclassified as an autoproducer. As a result, declines are observed in heat production from other bituminous coal and industrial waste, as heat reported as previously sold may now be considered as used onsite.

Other sources electricity and heat production is available from 2013 and represents generation from residual tail gases from the manufacturing of soot as well as from hydrogen.

Geothermal heat production from main activity producer heat plants is available from 1995.

Nuclear electricity production in main activity producer electricity plants is available from 1983.

Transformation

In 2022, the decrease in electricity output from geothermal was due to the plant not being in operation for several months.

In 2020, the efficiency of blast furnace gas- and coke oven gas-fired main heat plants was revised downwards back to 2017 to better reflect trade of coal gases and hot air between adjacent facilities.

In 2019, some breaks in series occur for plants fired by biogas and solid biofuels due to changes in plant classifications, and CHP methodologies.

In late 2017, a new geothermal power plant began operations.

For 2017, the decline in heat production from industrial waste is partly due to the reclassification of a main activity producer as an autoproducer.

Heat and electricity consumption by military services is reported under Other sectors - non-specified for the first time in 2015. The change is due to the recent authorization to disseminate these data. Previously they were included under Commercial and public services.

From 2014 data onwards, more data suppliers were involved in submitting energy data to the national administration, causing new autoproducer time series to appear for geothermal and industrial waste plants.
In 2014 data, some CHP plants running on solid biofuels produced only heat and were reclassified to heat plants.

The Hungarian administration reclassified some of their plants between 1996 and 2000, which may lead to breaks in the time series.

Prior to 2000, electricity output from sub-bituminous coal is included with lignite. Data on electricity and heat production from solid biofuels in autoproducer CHP plants are available from 1995.

Autoproducer electricity, CHP, and heat plants using coke oven gas and blast furnace gas were reclassified as main activity power plants in 1998.

Consumption

For 2020 onwards, electricity consumption in Road also includes plug-in hybrid electric vehicles (PHEV).

Data for direct use of solar thermal heat are available from 2001 and from 1990 for geothermal heat.
Iceland

Source

National Energy Authority, Reykjavik.

General notes

Prior to 1970, final consumption includes inputs and outputs to heat production.

The industrial classifications used by the Icelandic administration were changed in 1987.

Coal

General notes

Data on stock changes of anthracite and coke oven coke are not available. The statistical difference could include that flow.

For anthracite and coke oven coke, preliminary 2022 data on imports and inland consumption are estimated by the IEA Secretariat based on trade data of international sources.

The industrial classifications used by the Icelandic administration were changed in 1987.

Hard coal data prior to 1978 may include sub-bituminous coal.

Prior to 1970, final consumption includes inputs and outputs to heat production.

Consumption

Anthracite is used as a carbon donor in silicon metal and ferrosilicon production plants. In the 2021 edition, the quantities involved in these processes were reallocated from TFC/Iron & Steel to Non-Energy Use Industry/Transformation/Energy for the period 2016-2018.

Coke oven coke is used as carbon donor for ferrosilicon production. In the 2021 edition, the quantities involved in this process were reallocated from TFC/Iron & Steel to Non-Energy Use Industry/Transformation/Energy for the period 2016-2018.

Final consumption increased in 2000 as a new iron and steel plant came on-line.
Oil

General notes
In the 2023 edition, the Icelandic administration provided data for petroleum coke imports and non-energy use in non-ferrous metals from 1990 to 2009.

In the 2024 edition, stock breaks appear for the following products in the following years: LPG (between 2019 and 2020), gas/diesel oil (between 2018 and 2019) and fuel oil (between 2016 and 2017). Revisions are expected next cycle.

In the 2022 edition, some supply flows from 2015 to 2019 are estimated by the IEA Secretariat, in particular stock changes and imports.

Between 2015 and 2016, there are breaks for several products due to a change in the methodology by the Icelandic administration.

In 2014, the Icelandic administration revised petroleum coke data from 1990 to exclude imports of anodes for the aluminium industry.

Oil supply and consumption data for 2008 and 2009 are estimated by the IEA Secretariat.

Consumption
The use of fuel oil in Iceland territorial waters was banned in 2020 unless scrubbers are used. This explains the decrease in fuel oil consumption for energy-use in the fishing industry.

Biofuels and waste

General notes
In the 2023 edition, municipal waste was significantly revised from 1993 to 2013 according to new data coming from the Environment Agency of Iceland.

2021 biodiesel data are zero since the product was imported blended with fossil fuels products.

In the 2020 edition, the time series for solid biofuels was revised.

2013 is the first year of data availability for the supply and consumption of solid biofuels.
Consumption

**Biodiesel** consumption data for 2014 are estimated by the Icelandic administration based on 2013.

**Biogases** used for transport purposes were reported for the first time in 2007.

Electricity and heat

General notes

For the 2022 and 2021 editions, the Icelandic Admistration revised data back to 2007 due to improved methodologies.

Supply

In the 2024 edition, net electricity production from combustible fuels was estimated using historical values of own use.

In the 2022 and 2023 edition, **geothermal** data related to the demand side of the commodity balance were revised starting from 2007. Therefore, data breaks might appear between 2006 and 2007.

The rise in **heat** supply in 2018 is due to an increase in the number of residential and commercial connections to new and existing district heating networks.

The increase in **hydro** and **geothermal** electricity production from 2007 is due to the expansion of the aluminium industry.

The increase in **geothermal** electricity production in 2018 is due to a new 90MW power plant, half of which came online in 2017, and half in 2018.

From 2016 onwards, the decline in electricity production from **wind** is due to a combination of lower wind speeds and lower installed capacity.

Transformation

In the 2024 edition, input of diesel (kt) in main activity heat producers was estimated using a default net calorific value.

From 2017 onwards, due to data quality issues, the reported efficiency of electric boilers exceeds 100%. Revisions are pending.
For 2016, access to improved data revealed considerably better heat plant efficiencies than previously inferred, with increases in heat production seen during this period.

From 2013 data, the *Hellisheidi geothermal* power plant, previously reported under main activity electricity plant, was categorised as main activity CHP plant.

Heat production from *municipal waste* is available from 1993 and stops in 2010.

In 1998, 60 MW of generating capacity was installed in the *geothermal* CHP plant at *Nesjavellir*. Since the plant was inoperable for four months, production of *geothermal* heat decreased compared to 1997. The extra electricity capacity caused electricity production from *geothermal* to almost double over the same period.

Electricity production from *geothermal* sources in main activity producer CHP plants is available from 1992.

**Consumption**

The increase in electricity consumption in the *non-metallic minerals* sector from 2017 onwards is due to the opening of a silicon production facility, PCC Bakki.

The significant increase in electricity consumption in the *commercial and public services* sector from 2015 onwards is due to the growth of cryptocurrency mining.

In the 2015 edition, the *heat* consumption breakdown by sector for the years 1990 onwards has become available following reviews by the Icelandic administration. In addition, heat consumption was revised significantly upwards as more information became available. This has caused large breaks in time series across the heat balance between 1989 and 1990.

Direct use of *geothermal* in the industrial sector is reported under *non-specified industry*, as the Icelandic administration decided not to estimate the allocation amongst the sub-sectors of industry.

Revisions in direct use of *geothermal heat* starting in 2013 create breaks in time series between 2012 and 2013.

**Electricity** consumption in *non-specified transport* includes consumption for ferries and cruise lines.

Non-specified consumption of *electricity* within the energy sector refers mainly to the use of electricity by the *geothermal* industry to pump hot water from
underground sources, and from 1991, also includes electricity used for the transport by pipeline of hot water from Nesjavellir to Reykjavik.

The increase of electricity consumption in the construction sector from 2004 to 2007 is due to the drilling of tunnels for the Kárahnjúkar power plant.

The consumption of electricity reported in non-specified other corresponds to a NATO base at Keflavik airport which closed in 2005.

Prior to 1990, all heat for space heating was reported in residential.

The residential sector includes agriculture prior to 1983.

Prior to 1970, total final consumption includes inputs to and outputs from heat production and non-energy use. After 1970, data on inputs and outputs in CHP plants and in main activity producer heat plants (district heat plants) and for non-energy use are separately specified.
Ireland

Sources

Department of Communications, Energy and Natural Resources, Dublin.

Sustainable Energy Authority of Ireland, Cork.

Coal

General notes

In the 2023 edition, other bituminous coal demand statistics were revised from 1990 to 2020 as a result of the business Energy Use Survey run by the Central Statistics Office (CSO). Furthermore, also the calorific values and energy inputs of other bituminous coal imports and input to main activity producer electricity plants were revised from 2013 onwards due to a review of the data under the Emission Trading Scheme.

In the 2023, SEAI revised of anthracite and BKB imports, stock change (only for anthracite) and residential consumption due to new available information.

In the 2022 edition, the Irish administration modified the methodology to estimate supply of solid fuels. Consequently, revisions were made back to 2011 for anthracite, other bituminous coal and BKB.

In the 2021 edition, SEAI revised their methodology for anthracite imports. The figures for the years 2012 to 2018 were revised up and are now aligned with those from the Central Statistics Office of Ireland. The difference with the old values was assigned to the residential sector.

In the 2021 edition, SEAI revised other bituminous coal consumption by sector for the period 2005-2011. The same methodology that was used from 2012 was applied to the period 2005-2011 to align the time series.

Due to confidentiality reasons, patent fuel quantities are reported aggregated to anthracite figures.

Due to confidentiality reasons, inputs of anthracite, other bituminous coal and peat briquettes for patent fuel transformation are reported with residential consumption.

Prior to 1990, any imports of BKB were included with imports of peat products, as is the case for consumption.
The calorific value for peat production is weighted according to the origin: sod peat and milled peat. Sod peat has a higher calorific value than milled peat. In 2019, the production of milled peat decreased while sod peat stayed stable; this resulted in an overall higher weighted value.

**Supply**

Ireland stopped harvesting lower value milled peat in 2020 and will phase out production of peat briquettes by 2024.

Due to confidentiality reasons, anthracite imports include patent fuel imports.

Rainfall in 2012 led to the lowest peat harvest since IEA records began in 1960, requiring large stock drawdown and increased use of biofuels for electricity generation. In 2013, production targets were met before the end of the year however production continued in order to further build stocks to alleviate the potential impacts of future weather events.

Low production of peat in 1985 was due to a poor “harvest”, due to an unusually wet summer.

Production data for peat products (briquettes) are available from 1975.

**Transformation**

From 2018 the consumption of other bituminous coal decreases significantly as a result of the decline in coal-fired power generation. Imports of this product decrease accordingly.

A reclassification caused a break in the time series for peat consumption in the energy industry own use in BKB/peat product plants from 1989 to 1990.

The production of gas works gas ceased in 1987 due to fuel switching to natural gas.

Other bituminous coal inputs to main activity producer electricity plants increased from 1986 due to three new generating units at Moneypoint coming on-line.

**Consumption**

Disaggregated final consumption for 2022 has been estimated by the IEA Secretariat based on the final consumption share by sector in 2021.
The decrease in residential consumption of anthracite in 2019 is consequence of warmer weather, among other reasons.

The consumption of other bituminous coal and peat in the food, tobacco and beverages industry stopped in 2019.

**Oil**

**General notes**

Ireland started the production of co-processed biodiesel in 2021 which will result in refinery intake of biofuels. In the 2024 edition this is not yet reflected in the data and revisions are expected next cycle.

In the 2018 edition the Irish administration revised the methodology for reporting final consumption of oil products. This leads to some breaks in series between 2015 and 2016.

*From other sources* - natural gas of other hydrocarbons correspond to natural gas blended with refinery gas.

For confidentiality reasons, inputs of petroleum coke into patent fuel transformation are reported with residential consumption.

**Supply**

In the 2020 edition, the Irish administration revised gas/diesel oil and fuel oil consumption in international marine bunkers from 2006 onwards.

**Consumption**

In the 2024 edition, the Irish administration reviewed its methodology for gas/diesel oil which leads to an important increase for agriculture/forestry in 2022. Revisions are expected next cycle as quantities will be reallocated to the residential sector.

In the 2021 edition, oil consumption data were revised back to 1990 by the Irish administration to incorporate the results of the Business Energy Use Survey (BEUS), which provided a level of detail not previously available.

In 2014, the drop of fuel oil consumption in non-metallic minerals sector is linked with the replacement of HFO boilers by natural gas boilers as the primary source of steam for alumina production.
In 2013 and 2014, bitumen consumption data are not available and calculated as residual.

Between 2008 and 2009, there is a break in time series for gas/diesel oil, LPG, kerosene-type jet fuel and petroleum coke due to a new methodology being applied to sectoral demand by Sustainable Energy Ireland (SEI). This change also explains breaks between 2006 and 2007 for bitumen, lubricants, white spirit, and paraffin waxes.

Between 1989 and 1990, breaks in time series appear for consumption of gas/diesel oil, LPG, other kerosene and fuel oil as a result of a detailed consumption survey done for 1993. Data for historical years back to 1990 were revised by the national administration based on the results of this survey.

From 1986, gas/diesel oil consumption in the agricultural sector is available.

From 1970 to 1977, the split between commercial and public services and agricultural use of other kerosene has been estimated by the Secretariat. Consumption in commercial/public services includes quantities used by state-owned agricultural companies.

**Natural gas**

**General notes**

Since April 2017 there is no gas storage facility in Ireland.

**Supply**

**Natural gas** production has been increasing since 2015, as the Corrib Gas field began production at the end of that year.

Since 1996, the increase in imports is due to the depletion of the Kinsale gas field and the availability of a new pipeline system to the United Kingdom.

**Transformation**

Since 2006, a different methodology for allocating unsold steam from autoproducer CHP is used.

*Non specified transformation* corresponds to *natural gas* blended with *refinery gas*.
Consumption

In the 2020 edition, the results of the Business Energy Use Survey (BEUS) from 2009 to 2017, published by the Central Statistics Office, were used as a new basis for the breakdown of energy use in the consumption sector. Additionally, data was revised for the 2001 to 2009 period in order to avoid a timeseries break.

In the 2019 edition, the Irish administration revised the *distribution losses* based on new data coming from the Emissions Trading Scheme (ETS), which had a knock-on effect in the final consumption data, primarily for the *industry sector*.

In 2011 the increase in *non-ferrous metals* consumption is due to a fuel switch to *natural gas*.

Since 2009, the disaggregation of consumption into all the industry sub sectors excluding *non-ferrous metals* is done according to data from the Census of Industrial Production (CIP). The last energy consumption data available from the CIP are from 2009 and therefore the 2009-2015 subsector breakdown is the same every year.

In 2007 the increase in *machinery* consumption is due to changes in industry sub-sector structure and fuel usage.

In 2004, there is a break in the time series in *food, beverages and tobacco* consumption due to a change in methodology.

In 2003, feedstock use in the *chemical and petrochemical* industry stopped due to the shutdown of a fertiliser plant.

In 2001, *natural gas* consumption in the *iron and steel* industry stopped due to the shutdown of Ireland’s main steel plant.

Prior to 1986, detailed consumption figures for the use of *natural gas* in *industry* and *other sectors* are not available.

Biofuels and waste

General notes

Data for *municipal waste* are available from 2009.

Data for *solid biofuels* and *biogases* are available from 1990.
Supply

In 2022 edition, biogasoline production figures were revised. The production started in 2017.

In 2020, a new biodiesel plant began to produce.

Due to increased demand from a second waste to energy electricity plant which began operation in 2017, production of municipal waste increased sharply starting in late 2017.

Prior to 2011, production and trade of biogasoline and biodiesels cannot be distinguished due to confidentiality issues.

Transformation

In 2022 edition, 2019 solar PV generation figures were significantly revised.

In 2020, biogas started to be blended with natural gas in the main network.

Starting in 2016, the increase of electricity production of solid biofuels is a result of a decarbonisation programme and comes from a plant which is co-firing peat and biomass.

In 2012 and 2013, the renewable fraction of tyre-derived fuel (12%) used by a cement plant was reported by the administration under renewable municipal waste; the non-renewable fraction (88%) was reported under industrial waste.

Consumption

In the 2021 edition, there were revisions to the residential sector for solid biofuels (excluding charcoal).

In the 2020 edition, Ireland started reporting Pipeline transport based on the Emissions Trading Scheme data, available since 2005. The increase in 2016 is due to the coming on stream of the Corrib gas field.

The Biofuels Obligation Scheme places an obligation on suppliers of mineral oil to ensure that 8.695% (by volume) of the gas/diesel oil they place on the market in Ireland is produced from renewable sources, e.g. bioethanol and biodiesel. The obligation was increased from the 1st January, 2017, from the previous level of 6.383%.
Despite the Biofuels Obligation Scheme, bioethanol consumption decreased in 2017 because there was a reduction in overall motor gasoline use and of fuel tourism.

Increases in biodiesel consumption in 2017 are related to the Biofuels Obligation Scheme and to increases in road freight, which is heavily dependent on diesel oil.

The consumption of pure biodiesel in the industry sector and in road transport refers to one site, which is no longer in operation since 2014.

**Electricity and heat**

**Supply**

In the 2019 edition, revisions were made by the Irish administration for the indigenous production of solar thermal for the years 2011 – 2016.

Electricity production from wind begins in 1992 and from biogases in 1996. For wind, data for autoproducers are included in main activity producers prior to 2002 for confidentiality reasons.

**Transformation**

In 2018 and 2019, electricity output from other bituminous coal declined due to a shutdown at Moneypoint power station.

In 2017, a new municipal waste-fired main activity producer electricity plant (Dublin waste-to-energy) began operations.

In the 2016 edition, revisions were introduced in the electricity generation by fuel from 2010 due to improved data available from the transmission system operator.

In 2015, a new combined cycle gas turbine plant began commercial operations at Great Island power station, replacing the existing heavy fuel oil power plant.

In 2012, a new municipal waste-fired main activity producer electricity plant (Meath waste-to-energy) began operations.

In 2011, very little electricity was produced from pumped hydro following Turlough Hill, Ireland’s pumped storage station, being taken offline in late 2010 up until February 2012. The 2011 values appear as zero due to rounding.

From 1984 to 1989, inputs of hard coal in autoproducer CHP plants have been estimated by the Secretariat.
Consumption

Not elsewhere specified in industry refers to Other Manufacturing (NACE 31-33, 12 & 15) and Rubber and Plastic Products (NACE 22)

In the 2024 edition, electricity consumption data were revised back to 1990 thanks to the Central Statistics Office of Ireland gaining access to the metered electricity data, which allowed them to reweight a number of categories.

In the 2021 edition, electricity consumption data were revised back to 1990 to incorporate the results of the Business Energy Use Survey (BEUS), which provided a level of detail not previously available.

In 2004, the increase of electricity consumption is due to the new light rail transit system in Dublin.

The decrease of electricity consumption in the iron and steel sector from 2001 onwards is due to Ireland’s main steel plant ceasing production.

Prior to 1990, electricity consumption in agriculture/forestry is included with residential.

Electricity consumption in the iron and steel industry includes consumption in the non-ferrous metals industry prior to 1990.

Data for direct use of geothermal heat and solar thermal heat are available from 1989 and 1990, respectively.
Israel

Source

Israel Central Bureau of Statistics, Jerusalem.

General notes

Data are available starting in 1971.

The statistical data for Israel are supplied by and under the responsibility of the relevant Israeli administration. The use of such data by the OECD and/or the IEA is without prejudice to the status of the Golan Heights, East Jerusalem and Israeli settlements in the West Bank under the terms of international law.

Due to the unavailability of data for certain fuels, IEA estimations are also present in Israel data. In particular this is valid for oil data in 2014 and 2015, natural gas data from 2012 onwards, renewables and waste data in 2013.

Coal

Transformation

For preliminary 2022 data, use in transformation of other bituminous coal and oil shale and oil sands has been estimated by the IEA Secretariat.

In 2018 (data year) the methodology for calculating consumption in the transformation sector (electricity and heat producers) was modified. This creates a break in the time series between 2017 and 2018.

Oil

General notes

Supply data for 2013 to 2020 have been provided by the Israel Central Bureau of Statistics. Demand data for 2013 to 2020 was revised and estimated based on Israel’s national energy balance and the partial data made available by the Israel Central Bureau of Statistics. As a result, breaks in time series may appear between 2012 and 2013.

Israel’s national energy balance aggregates bitumen, petroleum coke and other oil products. The split of these products was estimated by the IEA secretariat for all flows.
The split of refinery output and consumption between kerosene type jet fuel and other kerosene was also estimated by the IEA Secretariat.

Supply and consumption of kerosene type jet fuel for 2011 and 2012 have been estimated by the IEA Secretariat.

From 2007 to 2009, oil data are estimated by the IEA Secretariat based on information from the Ministry of National Infrastructures.

**Supply**

In 2018 the CDU 3 unit and hydrocracker facility at Bazan refinery was under maintenance. In 2017 the catalytic reformer unit underwent maintenance.

Quantities of other hydrocarbons represent natural gas used in refineries, including for the operation of the cogeneration power stations.

From 2010 onwards, white spirit is included in other products.

**Transformation**

In 2017 Bazan refinery underwent maintenance to upgrade its continuous catalytic reformer, isomerization units and the naphtha catalytic hydrotreating unit.

**Consumption**

From 2015, energy use of gas/diesel oil and other kerosene in Not elsewhere specified (Other sectors) are estimated by the IEA Secretariat.

From 2013, consumption data are based on a new and detailed classification system and on estimations made by the Israeli administration.

**Natural gas**

**General notes**

Since 2012, all natural gas data, except inputs to electricity production and oil refineries, have been estimated by the IEA Secretariat.

The 2021 edition includes 2019 data and revisions in consumption based on the Energy Balances published by the Israeli Central Bureau of Statistics (CBS). As a result, breaks in time series appear between 2012 and 2013. More specifically, this revision impacted oil refineries, the industry sector and other sectors. Finally,
all industry is categorised as non-specified industry and all other sectors as non-specified other, because no disaggregation is available.

Supply

Transformation
In the 2017 edition, the Israeli administration revised transformation sector data back to 2013, introducing breaks in the series between 2012 and 2013.

In the 2019 edition, the not elsewhere specified (transformation) since 2013 refers to quantities of natural gas used for the generation of hydrogen, which is subsequently used for hydrodesulphurization in oil refineries. In the previous editions, these figures were reported as energy consumption of gas in oil refineries.

In the 2019 edition the 2016 and 2017 data for inputs to electricity production were estimated by the IEA Secretariat.

Biofuels and waste

General notes
Data on imports and consumption of charcoal are estimated since 1992 using data from the Forestry Production and Trade database from the Food and Agriculture Organization of the United Nations.

Electricity and heat

Supply
Electricity production from wind begins in 2001.

Autoproducer electricity generation from chemical heat (production of sulphuric acid) occurs, but is not reported separately or included elsewhere in national totals, prior to 2017.

For 2020, transmission and distribution losses for electricity include losses incurred during the operation of pumped hydro facilities.
Transformation

For the 2018 reporting cycle, Israel revised their methodology to better reflect actual plant classifications. As a result, breaks in series occur between 2017 and 2018 for output from all plant types.

Prior to 2018, inputs to autoproducer CHP plants (then reported under auto electricity plants) included inputs used to generate unsold heat. As a result, there is an apparent increase in efficiency for some fuels between 2017 and 2018.

For 2017 data and onwards, due to confidentiality concerns, electricity production reported under auto producer wind includes generation from main activity wind, total hydro, and autoproducer biogases. Similarly, for 2016 data, reported auto producer solar PV generation includes total generation from hydro and wind.

For 2013 and 2014, other oil products inputs to autoproducer electricity plants were estimated by the IEA Secretariat.

Data on heat production from main CHP plants are not available.

Consumption

For 2022, Electricity transmission and distribution losses were estimated by the IEA Secretariat.

Solar thermal indigenous production and direct consumption have been estimated by the IEA Secretariat from 2012 to 2017, using data published in the IEA-Solar Heating and Cooling Programme Annual Report. These estimations may create breaks in time series between 2011 and 2012 as well as 2017 and 2018.

For 2013 onwards, for reasons of confidentiality, electricity consumption in non-ferrous metals is included under mining and quarrying, and consumption in chemical (including petrochemical) and construction is included under not elsewhere specified (industry).

For 2013, and 2015 onwards, the split of electricity consumption in industry has been estimated by the IEA Secretariat. In addition, electricity consumption in agriculture and forestry for 2015 onwards has also been estimated by the IEA Secretariat.

Electricity own use, as well as transmission and distribution losses were estimated by the IEA Secretariat from 2010 to 2012.
Italy

Sources

Ministry of Economic Development, Rome.

Terna, Rome.

General note

A change in methodology lead to breaks in time series for industry and transformation between 2003 and 2004.

Coal

General notes

The increase in production of coke oven gas in 2012 was the consequence of improvements in scope of reporting. As such, coke oven gas data in prior years should be viewed as under-representing production and consumption, and coke oven efficiencies will likewise appear lower than actual.

Due to a change in the survey system, breaks in time series may occur between 1997 and 1998 for final consumption.

From 1986 onwards, figures from lignite are given using the same methodology as in the Bilancio Energetico Nazionale.

Supply

In the 2018 edition, production of coke oven coke, coke oven gas, coal tar and other recovered gases was revised back to 2014 due to new available information. The revisions increased efficiencies of coke ovens and blast furnaces and led to breaks between 2013 and 2014.

Other bituminous coal production ceased in 2016 due to the closure of the one coal mine in 2015.

Transformation

Breaks in the time series between 2014 and 2015 for coke oven gas, blast furnace gas and other recovered gases are due to a reclassification of main activity producers and autoproducers.
Prior to 2009, sub-bituminous coal used in main activity electricity plants was included with other bituminous coal consumption.

For data since 2001, calorific values for imports of other bituminous coal and sub-bituminous coal are derived from inputs to main activity electricity generation.

Consumption

In the 2023 edition, final consumption of anthracite is reported for 2021 for the first time due to improvements in the collection of data by the Italian administration.

In 1991, all industrial activities were reclassified on the basis of ISTAT/NACE 91. This has implied some transfers of activities which may result in some anomalies between 1991 and earlier years.

Oil

General notes

For crude oil, statistical difference may arise as trade corresponding to stock held for Austria and Germany in the Port of Trieste are not included.

Inputs to electricity and heat generation have been estimated by the IEA Secretariat for the years 1984 to 1997 based on submissions of the Electricity and heat Questionnaire. All other data for the years 1992 to 1997 and the detailed consumption breakdown for other years have been estimated by the IEA Secretariat based on Bilancio Energetico Nazionale.

Supply

Due to an improvement of reporting by the Italian administration, indigenous production of NGL is reported separately from crude oil starting in 2020.

Indigenous production of other hydrocarbons in 2020 is from the Gorgoglione field in Basilicata.

In the 2021 edition, due to a new calculation methodology adopted by the Italian administration, product transfers appear for the first time in 2019 for motor gasoline, kerosene type jet fuel, gas/diesel oil and fuel oil.

In 2016 and 2017, the closure of the Val d'Agri oil centre lasting several months led to a decrease in production of crude oil.
From 2009 onwards, transfers of lubricants could not be disaggregated from refinery output data.

From 2004 onwards, increased production of non-specified oil products is due to methodological changes.

A new survey to determine the split between international marine bunkers and domestic navigation caused a break in time series for gas/diesel oil in 1999 and fuel oil in 1996.

**Consumption**

Due to new information collected by the Italian administration, breaks appear between 2021 and 2022 for sectoral demand data of refinery gas.

For gas/diesel oil, non-specified use is included in commercial/public services.

Between 1998 and 1999, due to new surveys, breaks appear in the consumption time series.

**Natural gas**

**Supply**

In 2021, Exports increased substantially due to the TAP pipeline beginning operations.

**Transformation**

Prior to 2008, inputs of natural gas to all heat production in industry were reported in final consumption.

Between 2003 and 2004 there are breaks in time series in industry and transformation due to a new data reporting methodology.

From 2000 to 2002, for confidentiality reasons, autoproducers are included in main activity producer plants.

In 1996 the production of gas works gas from natural gas in gas works (transformation) ceased.

**Consumption**

Between 2020 and 2021 there is a break in the time series across total final consumption due to a change in methodology to improve data quality and align...
data between natural gas TSOs and operators collecting data in the distribution network.

In the 2021 Edition, following a new source of data and a change of methodology, the flows oil and gas extraction and gas inputs to oil refineries were revised from 2011 onwards.

Since 2007, a more detailed breakdown of consumption for energy industry own use is available.

**Biofuels and waste**

**Supply**

*Biogasoline* includes bio-ETBE.

From 2014, a distinction between trade and production became available for *other liquid biofuels*.

**Transformation**

The revisions to the transformation sector for many fuels for 2021 and the break in the time series with 2020 are due to the change in methodology for reporting main activity producers and autoproducers consumption described in the electricity section.

In 2018, a new biomethane plant was installed leading to increases in *biogas* blending with *natural gas*.

2017 is the first year that biogas is blended with natural gas.

In 2008, data for biofuels and waste were reclassified, which results in several breaks in the time series for transformation.

**Consumption**

In the 2024 edition, the drop in residential consumption of *primary solid biofuels* for 2022 reflects the results of a new survey on energy consumption in households.

In the 2024 edition, the new reporting of *primary solid biofuels* in not elsewhere specified in the energy sector for 2021 and 2022 refers to NACE codes 35.1/35.11/35.30. From the 2018 data onwards, the increase in *biodiesel* demand is related to blending obligations.
The final consumption of biogas has been constant from 2013 to 2015, as these figures are the result of a survey which is not carried out annually. Figures are expected to be revised after the next survey.

In the 2016 edition, the methodology used to calculate solid biofuels consumption in the residential sector for 2002 to 2014 was updated and this created a break in time series between 2001 and 2002. This also affects the indigenous production of solid biofuels. The revisions were limited backwards to 2002 because of reliability issues.

**Electricity and heat**

**General notes**

As of 2021, an alignment with international energy statistics standards in the definition of main activity producer and autoproducer caused a shift of production from main activity producer to autoproducer and vice versa. This leads to breaks in time series.

Prior to 2021, heat produced by Autoproducer includes all heat produced and auto consumed. As of 2021, heat sold only by Autoproducers is reported. Breaks may occur in time series.

**Supply**

Prior to 2021, electricity generated by autoproducers using solar PV is included under main activity producers.

Prior to 2021, data on transmission and distribution losses of heat consisted of heat units only. As of 2021, also transmission and distribution losses from CHP units are included. This leads to breaks in time series between 2020 and 2021.

For 2021, electricity output from autoproducer wind was reported for the first time in several years due to a reclassification of the producer type.

For 2017, more information became available on fossil fuel use in heat plants allowing additional inputs to be reported for this category. This causes breaks in time series between 2016 and 2017.

The production of electricity reported in the category other fuel sources refers to electricity produced from turbines which are located at pressure drops in fluid transport.
The methodology of data collection for photovoltaic electricity production changed in 2009 and the distinction between main activity and autoproducer plants could not be determined, causing a break in the time series.

Due to the aggregation of rounded values, from 2007-2016, total electricity output may differ slightly from the sum of the output from the individual fuels.

**Transformation**

For 2018, the decrease in electricity output from Solar PV was due to lower than solar radiation.

Prior to 2000, electricity used for pumped storage (mixed plants) is included under used for pumped storage (pure hydro pumping plants).

In 2016, the decline in autoproducer electricity generation and sold heat production by oil refineries is partly due to the activities of these units being split off and reclassified as main activity enterprises.

The methodology of data collection for the geothermal sector changed in 2010, causing a break in time series between 2009 and 2010.

Prior to 2009, sub-bituminous coal used in main activity electricity plants was included under other bituminous coal.

With the introduction of a new survey in 2008, amounts of naphtha and other kerosene that were previously included in other oil products have been reported separately in autoproducer CHP plants.

Prior to 2004, electricity production from orimulsion is confidential and is included with fuel oil.

Heat production is reported starting in 2004 and includes self-generation in industry.

From 2000 onwards, the Italian administration defines electricity and heat production from autoproducers as generation from producers that consume more than 70% of their own electricity production. However, for the 2000 to 2002 period, all electricity production from autoproducers is reported with main activity producers.

The breakdown of renewables and waste inputs into electricity, heat and CHP plants is available from 1989 only. Prior to that year, the total of the different fuels involved is reported as non-specified renewables.
Prior to 1984, net electricity production by autoproducers includes production from combustible fuel sources only.

**Consumption**

Prior to 2021, heat consumed by Autoproducer includes heat which is auto consumed. As of 2021, purchased heat only is reported.

For the 2021 edition, the Italian Administration changed system of reporting used to categorise consumption based on economic activity (from ATECUE95 to ATECO2007). As a result, breaks in series occur between 2018 and 2019. Historical revisions are pending.

Some breaks in-series for heat consumption are observed between 2017 and 2018. This is because some large heat producers reported consumption of heat in 2018 in sectors different to those they had reported in previous years.

*Non-specified energy industry own use* includes electricity consumption for blast furnaces. From 2000, it also includes consumption for the distribution of gas and prior to 1989 consumption for uranium extraction.

The breakdown of heat consumption by sector is estimated by the Italian administration.

Revisions of the final consumption of heat by the Italian administration led to breaks between 2010 and 2011.

From 1981, consumption of electricity in transport includes electricity used for pumping in oil pipelines.
Japan

Source

The Institute of Energy Economics Japan, Tokyo.

General notes

In the 2019 edition, data for Japan were revised back to 1990 based on new methodology. Additional details are given under each fuel.

From 1990, data are reported on a fiscal year basis (e.g. April 2015 to March 2016 for 2015).

Consumption data for commercial/public services may include consumption in small and medium-sized industries. The Japanese administration expects that this shortcoming will be corrected in the near future.

Coal

General notes

Other bituminous coal includes sub-bituminous coal.

The net calorific values for coal and coal products have been recalculated by the IEA Secretariat based upon gross values submitted by Japan.

In the 2023 edition, the Japanese administration revised several flows for anthracite, other bituminous coal and coke oven coke for 2020 due to new available information. Hard coal data prior to 1978 may include sub-bituminous coal.

Supply

In the 2022 edition, revisions were made by the Japanese administration to imports by origin and exports by destination, back to 1990.

In the 2020, revisions were made by the Japanese administration to the imports of other bituminous coal for the years 1991, 2015 and 2017.

Statistical differences for hard coal include stock changes since 2001. Large positive differences for several years since 2004 are partly due to stock build by final consumers.
Transformation

The inputs of coke oven coke to blast furnaces as well as the final consumption of coke oven coke in the iron and steel industry have been estimated by the IEA Secretariat since 1990.

From 1998, inputs of coke oven gas, blast furnace gas and other recovered gases into autoproducer electricity plants include the amount used to produce electricity with TRT technology (Top pressure Recovery Turbines) which was previously included in industry.

Inputs of manufactured gases (coke oven gas, blast furnace gas and other recovered gases) to main activity electricity and heat plants are calculated based on outputs and using efficiencies of main activity producers from other fuels. For autoproducers, the specific inputs are known, however the specific electricity production by each gas is estimated based on a pro-rata of the total electricity generation from all gas types.

Coal injected in blast furnaces (PCI) is classified as coking coal in order to be consistent with Japanese trade statistics.

In 2016 the liberation of the power market resulted in electricity autoproducers becoming main activity producers.

Consumption

In the 2023 edition, non-energy use in chemical and petrochemical sector of coke oven coke was revised from 1994 to 1998 due to new available information.

In the 2020 edition, anthracite consumption in agriculture/forestry has been revised.

In the 2020 edition, after investigation by the Japanese administration the coal tar previously reported under total final consumption in the chemical sector has been reallocated under the category non-energy use.

In the 2019 edition coal tar consumption in the chemical and petrochemical industry was estimated by the IEA since 1990.
Oil

General notes

In the 2022 and 2023 editions, data for Japan were revised back to 1990 by the Japanese administration due to revisions in Japan's energy balance table.

In the 2021 edition, data for Japan were revised back to 1990 by the Japanese administration based on new methodology for the Energy Balance Table.

In the 2021 edition, the Japanese administration revised several NCVs of both primary and secondary oil products back to 1990 as a result of improved calculation methods. The Japanese administration reviews calorific values every five years.

In the 2020 edition, data for Japan were revised back to 1990 by the Japanese administration based on new methodology and coverage for the Energy Balance Table. The revisions mainly concern the demand side (in particular, consumption in road transport and chemical industry), resulting in improved statistical difference in the time series.

In the 2019 edition, data for Japan were revised back to 1990 by the Japanese administration based on new methodology for the Energy Balance Table.

In the 2016 edition, the Japanese administration revised several NCVs of both primary and secondary oil products back to 1990. The Japanese administration reviews calorific values every five years, with the other most recent revisions occurring in 2005 and in 2013.

Supply

In 2018 refinery runs were impacted by heavier than usual maintenance season.

The high statistical difference for crude oil in 2013 and 2014 is explained by large amount of stocks held on board incoming vessels in port or at mooring in March 2014 (end of Japan’s 2013 financial year). These amounts are included in the stock change but not in the imports in 2013 annual data.

Orimulsion was imported for electricity generation between 1991 and 2006.

Transformation

Other hydrocarbons in non-specified transformation represents orimulsion burnt for power generation. Historical revisions are pending.
In 2016 the liberalisation of the power market resulted in electricity autoproducers becoming main activity producers.

Consumption

Due to the data being in fiscal years, the impact of COVID-19 is visible in 2019 as oil consumption in some sectors decreased between January and March 2020.

Oil consumption continued to fall in 2018 as more nuclear capacity came back online.

Demand for heating oil and other kerosene fell driven by a warmer than usual winter in 2018.

Road consumption, is based on the “Automobile fuel consumption survey” from the Ministry of Land, Infrastructure, Transport and Tourism (MLIT).

**Lubricants** consumption is estimated by the Japanese administration since 2000.

**Natural gas**

General notes

The 2022 edition contains minor revisions to time series which go back to 1990 for *imports* and *stock levels*. These reflect the revisions in the Energy Balance Table from the Ministry of Economy, Trade and Industry, which is the data source.

The 2019 edition contains major revisions to time series which go back to 1990. These reflect the revisions in the Energy Balance Table from the Ministry of Economy, Trade and Industry, which is the data source.

Since 1990 most of the *gas works gas* production and consumption has been included with *natural gas*.

Supply

In the 2019 edition, *indigenous production*, *receipts from other sources*, import data, *stock changes* and stock levels were revised back to 1990.

Transformation

In the 2019 edition, *main activity* and *autoproducer electricity* plants were revised back to 1990. Similarly, flows of the *energy sector* were revised back up to 1990.
Consumption

In the 2019 edition, own consumption in electricity, CHP and heat plants was subject to a major revision since 1990.

In the 2019 edition, all the transport sector, industry sector and other sectors flows were revised back to 1990.

Biofuels and waste

General notes

In the 2024 edition, the Japanese administration revised several supply and demand flows for industrial waste, municipal waste and primary solid biofuels for variable time periods, even starting in 1990, due to new available information.

In the 2023 edition, 2022p production data for biogasoline is 0. In the 2024 edition, also the 2021 production has been revised to 0 by the Japanese administration.

In the 2019 edition, data for Japan were revised back to 1990 based on new methodology.

There was a large revision in municipal waste data in the 2016 edition of this publication. This revision has removed data for municipal waste for the entire time series up to 2010.

For municipal waste data, the breakdown between renewable and non-renewable municipal waste is estimated by the IEA Secretariat assuming a 50% split in transformation and supply.

Transformation

Input data of solid biofuels to charcoal production are estimated by the IEA Secretariat assuming an efficiency of 40%.

In the 2024 edition, the amount of biogases blended with natural gas in the gas grid in 2022 is estimated by the Japanese administration as equal to 2021, because the actual quantity is unknown by the time of the publication. This is likely to be revised in the next publications.

The industrial waste consumption in the non-specified transformation sector surged in 2013, because of the increase in use of waste plastics for coke production.
**Electricity and heat**

**Supply**

In the 2019 edition, *electricity* data were revised back to 1990 to include additional autoproducer production previously excluded.

Due to the liberalisation of the *electricity* market in April 2016 some generation previously reported under autoproducer plants is reported as main activity producer from 2016 onwards. As a result, breaks in series occur between 2015 and 2016. In particular, for *solar PV* and *wind*.

In the 2019 edition, the methodology used to estimate *heat* production from other sources was revised.

Generation of electricity and heat from *combustible fuels* is calculated by removing electricity and heat generation from other sources, such as wind, solar and nuclear, making it a residual item. Splits between combustible fuel types and consumption flows are also calculated.

Due to the events related to the March 2011 tsunami, the Japanese administration decided to scale back the level of their *nuclear* programme. As a consequence, there was no nuclear electricity generation in 2014. The nuclear electricity generation started again at a greatly reduced scale in 2015, while significant increases were observed in 2017 and 2018, with generation resuming at several facilities (2017: Takahama 3 and 4, Ooi 3, and Genkai 3; 2018: Genkai 4, Ikata 3, Ooi 4). In 2020, output decreased due to inspections at some plants.

**Other sources** electricity represents electricity generated with purchased steam. Other sources heat represents heat derived from waste heat.

Net and gross electricity generation from autoproducers are equal, as no information is collected concerning autoproducer own use.

Own use at main electricity plants has been constant since 2015, as data are no longer available following liberalisation.

Data for *electric boilers* include *heat pumps*. For this reason, calculated efficiencies exceed 100% for some years.

Heat produced for sale in main activity producer heat plants from waste heat and from electric boilers is available from 1977 and 1983, respectively.

**Transformation**

The Japanese Administrations attributes heat outputs (with the exception of heat from electric boilers) to individual fuels based on their share of inputs, assuming efficiencies are 100% or less. As a result, fuel specific transformation efficiencies may not reflect actual efficiencies.

Data on heat produced for sale by autoproducer heat plants are not available.

Fuels used and corresponding electricity and heat produced in CHP plants are not included in the CHP data time series, but instead are reported as separate electricity or heat components, leading to some plant efficiency figures not to be accurately calculated. Inputs of biofuels and waste for electricity production and related outputs are available from 1982.

Net electricity production by autoproducers prior to 1982 includes production from combustible fuel sources only.

Between 1972 and 1976, the use of combustible fuels in main activity producer heat plants is included in non-specified.

**Consumption**

In the 2020 edition, there are revisions in the consumption of solar thermal in the commercial and public services and residential sectors in 1990 - 2004.

Consumption of electricity in non-specified industry includes wood and wood products and construction prior to 1982.
Korea

Sources

Korea Energy Economics Institute, Ulsan.

Korea National Oil Corporation, Ulsan.

General notes

Data are available starting in 1971.

Until the 2023 edition of the database, data for 2002 onwards had been reported on a different basis, causing breaks in time series between 2001 and 2002, especially for inputs and outputs to electricity generation and consumption in the iron and steel industry. For the 2024 edition, the Korean administration has undertaken a major historical revision, erasing most of these time breaks.

Heat and power plants with secondary oil products may show implausible transformation efficiencies or encounter missing inputs/outputs. This can be attributed to different sources when compiling commodity statistics. Oil statistics are based on standards by the Korea National Oil Corporation whereas electricity statistics rely on surveys from heat and power plants.

Coal

General notes

Data for coal and coal products from 1971 to 2001 are based on information provided by the Korean administration, as well as information from the Yearbook of Energy Statistics 2002, the Yearbook of Coal Statistics 2001 (both from the Ministry of Commerce, Industry and Energy), and Statistics of Electric Power in Korea 2001 (from the Korea Electric Power Corporation). During this period, import data by coal type were estimated by the IEA Secretariat, based on statistics of the exporting countries.

Hard coal data prior to 1978 may include sub-bituminous coal.

Transformation

From the 2024 edition of the database onwards, the IEA and the Korean administration adjusted the quantity of coke oven coke in output of coke ovens in
order to keep energy efficiency of coke ovens below 100% in 2015 and in the years before 2010.

Statistical differences for manufactured gases for 2012 are partly the result of classification issues. The Korean administration is working to improve reporting of coal-derived gases production and consumption.

Consumption

In the anthracite balance, the category Non-specified (Industry) includes manufacture of cement, lime, plaster and its products, and small businesses. Currently the breakdown of those is not available.

The consumption of other bituminous coal in the Food, beverages and tobacco industry stopped in 2018.

Data on blast furnace gas used for energy purposes in blast furnaces prior to 2007 are reported in the iron and steel industry.

Consumption of imported coke oven coke starting in 2002 is reported under non-specified industry.

Consumption of manufactured gases in the iron and steel industry starting in 2002 includes the consumption in blast furnaces, oxygen steel furnaces and other iron and steel processing plants.

Oil

Supply

There are breaks in transfers of several oil products in 2020 owing to a change in the reporting methodology of a refinery that expanded its chemical plant.

The production of heavy distillates has been declining due to the expansion of heavy oil upgrading facilities.

In 2017, due to constraints to imports of condensate, Korean refineries used naphtha into the refinery process.

From 1997, stock levels include vessel stocks.

Transformation

Fuel input to heat and power plants in electricity and oil statistics may show discrepancies due to different sources in compiling commodity statistics. Oil
statistics are based on standards by the Korea National Oil Corporation whereas electricity statistics rely on surveys from heat and power plants.

In particular, inputs of fuel oil to autoproducer electricity and autoproducer CHP are included with final consumption.

**Consumption**

Due to the change in the reporting methodology of a refinery, some breaks may appear between 2019 and 2020, in particular for consumption in Chemical (including petrochemical) industry.

From 1990 to 1995, kerosene type jet fuel split between international civil aviation and domestic air transport has been estimated.

**Natural gas**

**General**

In the 2024 edition, general revisions were made for the entire time series, 1990 to 2022. The revisions were made due to new more reliable data sources being used and a change in methodology to provide more detailed data.

**Supply**

Since 2013, receipts from other sources – oil is estimated using the historical relationship with the Oil Questionnaire and extrapolating.

Korea reports production of natural gas since 2005.

The receipts from other sources from 2006 to 2012 represent the amount of LPG that are either blended with natural gas or are directly used in city gas distribution networks.

**Transformation**

Consumption in not elsehwere specified (Transformation) represents gas that is used in hydrogen fuel cell generators.

**Consumption**

Prior to 2015, energy industry own use in liquefaction plants included losses and measuring errors.
From 1993 to 2006, consumption of natural gas in *transport equipment* is included in the *machinery* flow.

From 1987 to 1991, the breakdown of final consumption has been estimated by the IEA Secretariat, as well as the *residential* subsector for 1992.

### Biofuels and waste

#### General notes

In the 2024 edition, the Korean administration revised the capacity of *hydro* and *wind* for their entire time series, due to new available information.

Due to the change of reporting methodology, breaks in time series may occur between 2013-2014 and 2014-2015.

Heat data are available starting in 1993.

#### Transformation

Inputs to *autoproducer* heat plants have been estimated by the IEA Secretariat because of efficiency issues for municipal waste prior to 2011 and in 2012 and for biogas in 2008, 2011 and 2012.

New plants were included in the Korean survey creating breaks in time series in 2011.

In 2007, some main activity heat plants and autoproducers in the commercial/public services sector were reclassified as main activity CHP plants, resulting in a break in the time series between 2006 and 2007 for *biogases*.

### Electricity and heat

#### General notes

In the 2024 edition, *heat* production data were revised for all years starting from 1990. The revised data shows considerably higher levels of *heat* production compared to previous records. *Heat* production for numerous products was back calculated using fuel input as a basis. These revisions may have established fixed efficiencies that resemble default values in the calculations. The Korean administration continues its efforts to enhance data quality, and revisions may be made in upcoming cycles.
The significant increase in heat production, supply and consequently consumption from 2016 to 2017 can primarily be attributed to the uncertain data situation of heat production and heat sold from autoproducer plants. These figures are estimated by the Korean administration, as pointed out above, mainly by taking fuel input as a basis.

Electricity statistics from 1971 to 1993 have been estimated by the IEA Secretariat based on the Korean National Statistics. Data from 1994 have been submitted by the Korean administration. This leads to breaks in time series between 1993 and 1994.

**Supply**

In the 2024 edition, portions of electricity production from combustible fuels in autoproducer CHP plants were reallocated to autoproducer electricity plants for all years beginning in 1990.

The own use of heat in heat plants is very irregular due to a lack of data.

Electricity generation reported under other sources is from fuel cells.

Production of tidal electricity began in 2013.

Data for heat from chemical processes that is sold are available from 2008.

Data for electricity production using heat from chemical processes in copper and zinc plants are available from 2005. The corresponding heat inputs were estimated until 2013 data. In 2014, the company concerned switched to diesel oil for electricity generation.

**Transformation**

For 2020, the increase in electricity output from nuclear was due to the 1.4 GW reactor (Singori #4) coming online, as well as higher utilisation rates. For 2018, the decrease in electricity output from nuclear was due to a combination of shutdowns for maintenance, and the closure of the Kori and Wolseong nuclear power plants in June 2017 and June 2018 respectively.

For 2018, the increase in heat production from natural gas was in part due to the commencement and expansion of operations at two CHP plants (Hwaseong Dongtan and Anyang).

For 2017, the decrease in electricity production from residual fuel oil is due to the closure of two main activity producer plants.
Some discrepancies exist between data reported for residual fuel oil in the oil databases and the electricity and heat databases. The Korean administration hopes to remedy this situation in a coming cycle.

Data for electricity and heat production by autoproducers using natural gas and liquid fuels are available from 2000.

In 2000, the Korean administration started to report heat statistics for some heat plants which were not reported before.

Between 1993 and 1999, the breakdown of heat output by type of fuel was estimated by the IEA Secretariat.

Consumption

Data for direct use of geothermal heat are available from 2002. Geothermal direct use data are overstated as it refers to heat production by geothermal heat pumps, which include inputs of electricity and/or gas in the transformation process.

Heat consumption by subsector was reclassified in 2010 due to new information available on heat sales from autoproducers to end-users by sector.

Prior to 2008, sales of electricity by Korea’s main electricity distributor, KEPCO, to the non-ferrous metals sector are included in iron and steel consumption.

Data on production and consumption of electricity and heat in oil refineries and LNG liquefaction/regasification plants are included in the industry sector. From 2007, oil refinery electricity and heat production and consumption started to be reported under the correct energy sector.

Data for heat consumption by sector are available from 2000.

Data for electricity consumption in the transport equipment sector are included in machinery from 1994 to 1999.
Latvia

Source
Central Statistical Bureau, Riga.

General notes
Data for Latvia are available starting in 1990. Prior to that, they are included in Former Soviet Union in the publication World Energy Statistics.

Breaks in the time series appear for inputs to and outputs from electricity and heat generation between 2016 and 2017 due to a change in methodology. This is most notable for main activity producer CHP and Heat plants. Data for 2017 onwards are reported on a unit basis, whereas data for previous years are reported on a plant basis.

Coal

Supply
The increase of distribution losses for peat in 2003 is due to a fire in one of the warehouses.

Transformation
In 2024, calorific values of peat used for producing peat briquettes were revised for years 2020 and 2021, thus bringing the transformation process efficiency back to feasible levels from these years onwards.

Consumption
The drop in the iron and steel industry in 2014 is due to the bankruptcy of the major company in the market.

Oil

Supply
Other hydrocarbons data represent shale oil.

In 2020, changes in the national legislation mandated an increase in the minimum blending of biofuels.
In 2018, amendments to the legislation mandated a biofuel blending target of at least 4.5% of volume for gas/diesel oil used in temperate and severe winter conditions leading respectively to an increase of its consumption for road transport.

In 2018 one of the main players in marine bunkering at Latvia’s largest port ceased operations. As a result deliveries of oil products to marine bunkers decreased in that year. As of 2019 the issues have been resolved and bunkering activity has resumed.

Consumption
In 2020, consumption of LPG in fishing is reported for the first time as a company changed its type of activity from NACE 1020 to NACE 0311.

Consumption of LPG and bitumen in mining/quarrying are reported for the first time as an asphalt concrete plant started operating in 2020.

Natural gas

Consumption
The consumption in the iron and steel industry decreased in 2014 due to the bankruptcy of the major company in the market.

Transformation
In 2017 there was a steep decrease/break reported in main activity producer CHP consumption and a respective increase/break in main activity producer heat consumption due to the classification of natural gas inputs according to the individual units of the plants instead of the plants as a whole that was previously used.

Biofuels and waste

Supply
For 2018 data, the increase in the indigenous production of solid biofuels is due to wood pellet production.

In 2017, a biodiesel producer exported amounts produced in 2017 and also some amounts from stocks.
Transformation

Heat production from solid biofuels has increased in 2021 due to a colder heating season. Moreover, many heat producers have increased their input of biofuels compared to other fossil fuels.

Due to a reclassification in 2004, there was break in time series of electricity production from autoproducer electricity plant fuelled by biogas between 2003 and 2004.

Consumption

The increase in consumption of solid biofuels in not elsewhere specified (industry) in 2018 is related to increases in the manufacture of furniture sector.

The increase in inland consumption of biodiesel in 2018 data is related to the implementation of favourable legislation (the “Biofuel Law”).

From 2014 to 2017, biodiesel consumption has been decreasing due to policies which support the sale of arctic diesel fuel without renewable additives.

Electricity and heat

Supply

In 2019, the first large-scale main activity solar thermal district heating plant opened in Latvia.

For 2017, higher rainfall resulted in a significant increase in electricity output from hydro, and a decrease in both imports of electricity and output from combustible fuels.

Heat production from other sources represents waste heat recovered from industry, and heat produced by condensing economisers.

Transformation

From 2012 onwards, the increase in electricity production from solid biofuels is due to the deployment of six new main activity producer CHP plants running on wood chips.

Consumption

Prior to 2020 data, all electricity consumption in the Energy sector was included in own use of electricity in power plants.
Prior to 2015 data, electricity consumed by trams at one of Latvia’s three tram operators was included under *road*.

For 2012, the increase in electricity consumption in the *iron and steel* sector is due to a facility switching from an open hearth furnace to an electric arc furnace.
Lithuania

Source
Statistics Lithuania, Vilnius.

General notes
Data for Lithuania are available starting in 1990. Prior to that, they are included in Former Soviet Union in the publication World Energy Statistics.

Oil

Supply
In 2020, changes in the national legislation mandated an increase in the minimum blending of biofuels.

Natural gas

Supply
The export quantities since 2014 represent imported LNG which is regasified and subsequently exported to other countries.

Transformation
Not elsewhere specified (transformation) data represent natural gas used for methanol manufacture, which is used as input in oil refineries.

Consumption
Natural gas consumption for power generation has been falling significantly from 2010 onwards as gas-fired power and heating plants are being retired, largely replaced by biomass.

There is a break between 2010 and 2011 in the not elsewhere specified (energy) timeseries due to natural gas being consumed for heat that was used to destroy radioactive waste after the decommissioning of the only Lithuanian nuclear plant at the end of 2009.
Biofuels and waste

Supply
In 2019, the increase in the indigenous production of industrial waste (non-renewable) is the result of increased data availability.

The production of charcoal has been over-estimated prior to 2017 due to the fact that it was not possible to report data less than 1 kt.

Starting from 2016, some industrial waste (renewable) was collected via sorting. These wastes consist of non-recyclable paper, textiles and wood wastes and their production is included in solid biofuels.

Transformation
In 2020, the Kaunas Cogeneration Power Plant, which produces energy from industrial and municipal waste, became operational. This led to an increase of heat and electricity generated from these products.

The Fortum Klaipėda CHP plant produces electricity and heat from industrial waste (non-renewable), municipal waste and solid biofuels since the end of 2013. Since its inception, structural optimisation has been sought. Additionally, before 2016, calorific values of the fuels were calculated by taking samples of fuels and after this period, calculations were made from steam. For these reasons, there are fluctuations in fuel inputs, energy production and fuel ratios between industrial waste (non-renewable), municipal waste and solid biofuels since 2013.

In 2013, an incinerator combusting industrial waste (non-renewable) and municipal waste began operations.
Electricity and heat

Supply
In 2021, there is an increase of electricity and heat production from industrial and municipal wastes. This is due to the Vilnius CHP plant becoming operative.

In 2021, heat production from natural gas and fuel oil increased due to some heat plants using significantly more these fuels.

In 2020, there is a spike of heat production from autoproducers heat plants in commercial and public services sector. This is due to Forest Investment plant that changed NACE classification.

Transformation
For 2022, the decrease of heat output from chemical heat and electricity production from chemical heat is due to the disruption of raw materials supply for the chemical industry. In 2009, the Ignalina nuclear power plant, the only nuclear plant in Lithuania, closed down.

In March 2017, the Geoturma geothermal heat plant, the only geothermal heat plant in Lithuania, closed down.
Luxembourg

Source

STATEC, Institut national de la statistique et des études économiques du Grand-Duché du Luxembourg, Luxembourg.

Coal

General notes

For the 2011 edition, the Luxembourgian administration revised the time series from 2000 for most coal and coal products. Time series for BKB consumption were revised from 1990.

Prior to 1978, some sub-bituminous coal may be included in hard coal.

Steel production from blast furnaces ceased at the end of 1997.

Oil

Consumption

In the late 1970s, the reduction in consumption of fuel oil in the iron and steel industry was due to substitution by coal.

Supply

Exports of bitumen and LPG include transit trade. The Luxembourgish administration is currently investigating, and revisions are expected next cycle.

Natural gas

General notes

In 1982 there is a break in the time series in transformation and industry due to a change in methodology.

Transformation

In the 2017 edition a main activity producer CHP plant was reclassified as one main activity electricity producer plant and one main activity producer heat plant. Data were revised back to 2014.
Since 2002, the increase in the transformation sector is due to a new 350-MW combined cycle power plant.

The last main activity producer electricity gas-consuming plant closed in 2016.

Consumption

Between 2020 and 2021 there is a break in the time series of the industry sector due to a change in methodology in which energy consumption is estimated at the company level and a NACE reallocation of notable companies.

In 2015, Luxembourg integrated supplementary data from ETS companies and industrial consumption was revised back to the year 2000.

The breakdown of total final consumption for the latest year is preliminary and will be finalised in the next edition of the book.

Since 2012, the methodology to determine final consumption was changed in order to integrate basic data from National Accounts.

Since 2000, a more detailed breakdown of final consumption data is available due to a change in methodology.

Since 2000, consumption in the non-ferrous metals sub-sector is included in iron and steel for reasons of confidentiality.

Since 2000 consumption in not elsewhere specified (Industry) includes activity of companies reclassified to preserve the confidentiality.

Prior to 2000, residential consumption includes consumption in commercial/public services and agriculture/forestry.

Biofuels and waste

General notes

The Luxembourgian administration started including trade figure of wood chips in trade figure of solid biofuels from 2015 data. This creates breaks in time series between 2014 and 2015.

Data on solid biofuels are available from 1992.
Supply
There was a fire at the co-digestion plant Itzig in September 2018. The plant was not reopened until October 2019, causing a decrease in biogas production (specifically: other biogases from anaerobic fermentation).

Transformation
In the end of 2018, there was a fire in one of the main biogas plants and it has been off for most of 2019. The most notable effect has been on biogas blending.

In 2011, the blending of biogases with natural gas started.

Consumption
In the 2023 edition, values for ambient heat in the Residential sector were revised back to 2013 due to a new data source.

Electricity and heat

General notes
In the 2024 edition, several values for 2021 were revised thanks to new information available.

Data for solar thermal are available starting in 2001 and for solar PV starting in 2000.

A revision in the classification of power plants by type and the production and consumption data for both electricity and heat back to 2000 causes breaks in the time series.

Supply
Most of the hydro production shown for Luxembourg is from the Vianden pumped storage plant and is exported directly to Germany.

There were some repairs on the upper basin of the pumped storage site at Vianden in 2019 leading to a reduction in electricity production. The full storage capacity was not available during this period.

In the 2017 edition, following plant reclassification, heat production by main activity plants was revised from 2011 onwards.
Starting in 2005, data for electricity transmission and distribution losses were obtained from the network operator. Prior to that, they were estimated by the Luxembourgian administration.

For Main CHP, own use data are not available for solid biofuels- or natural gas-fired plants.

**Transformation**

A natural gas fired, main activity electricity plant (TGV Twinerg) closed in 2016.

The production of electricity from solid biofuels from 2013 corresponds to the opening of a new plant burning wood wastes.

Data on electricity production from biogases are available from 1998 and heat production from 2010.

In 2002, the increase in electricity production is due to a new natural gas combined cycle power plant.

At the end of 1997, the iron and steel industry stopped production of electricity.

Electricity data for natural gas autoproducer CHP plants are available starting in 1995, and for main activity CHP plants starting in 1996.

Prior to 1990, net electricity production by autoproducers includes production from combustible fuel sources only.

**Consumption**

Heat consumption in industry and commercial and public services is estimated based on National Accounts. When not available, heat consumption figures for the most recent year reported are estimated based on data for the preceding year.

In 2015, the observed declines in the heat used in the textiles and leather and chemical and petrochemical sectors lead to the closure of two industrial main CHP plants. The heating needs of these sectors were met through direct purchase of natural gas, due in part to attractive pricing during this period.

In 2015, following the procurement of new information, data for heat distribution losses and heat consumption in industry and energy sectors were revised from 2000 onwards.

A change in the data source caused some breaks in the industry electricity consumption time series between 2010 and 2011.
The breakdown of electricity consumption in industry is not available from 1990 to 1999.
Mexico

Source

Secretaría de Energía, Mexico City.

General notes

Data are available starting in 1971.

The Mexican administration submitted data directly by questionnaire for the first time with 1992 data. As a result, some breaks in time series may occur between 1991 and 1992. For prior years, data are partly estimated based on the publication Balance Nacional - Energía.

In the 2016 edition, the Mexican administration completed a major work on revisions of the time series back to 1990. Revisions for some products include reporting of new consumption flows, increased quantities of coal and higher calorific values, resulting in increases of total primary energy supply.

Coal

General notes

In the 2024 edition, several products were estimated for the data year 2022, based on the growth rate that came from the “Balance Nacional de Energía” published by the “Secretaría de Energía”.

In the 2023 edition, the Mexican administration revised production, blast furnace use in transformation, coke oven energy industry own use and final consumption of coke oven coke for 2020 due to new available information.

The time series for blast furnace gas and inputs of coke oven coke to blast furnaces start in 1991.

Hard coal data prior to 1978 may include sub-bituminous coal.

Supply

In the 2024 edition, the IEA Secretariat estimated coke oven coke production, transformation and energy use for the data year 2022 based on the figures for “coque de carbón” of the “Balance Nacional de Energía” published by the “Secretaría de Energía”.

In the 2024 edition, the IEA Secretariat estimated **coke oven gas** production for 2022 was estimated by the IEA Secretariat proportionally to the coking coal input to coke ovens to keep the efficiency of the coke oven within the acceptable range.

In the 2023 edition, **other bituminous coal** imports for 2021, including imports by country of origin, have been estimated by the IEA Secretariat.

In the 2023 edition, the IEA Secretariat estimated **coke oven coke** production based on the figures for “coque de carbón” of the Balance Nacional de Energía 2021 published by the Secretaría de Energía.

In the 2023 edition, **blast furnace gas** production for 2021 was estimated by the IEA Secretariat proportionally to the coke oven coke input to blast furnaces in order to keep the efficiency of the blast furnaces within the acceptable range.

Many coal mining units reduced production during 2019, specifically mines in Coahuila (the largest coal producer state). This is reflected in the production figures of **coking coal** and **sub-bituminous coal** for that year.

Imports by country of origin for other bituminous coal and coking coal for 2016 have been estimated by the IEA Secretariat, based on partner data.

Blast furnace gas production and consumption have been estimated by the IEA for 1990 to 2017 based on inputs of coke oven coke to blast furnaces.

Coke oven coke production was estimated by the IEA for some years between 1999 and 2012 based off historical and commodities data, as were inputs of coking coal to coke ovens between 1990 and 2012.

The methodology currently used by Mexico to estimate production of coal tar and coke oven gas for recent years uses coke oven coke production as a guide. This was extended to the time series from 1990 to 2001, and to the years where coke oven coke production was estimated by the IEA.

**Consumption**

In the 2024 edition, the IEA Secretariat estimated the distribution of demand of **coke oven gas** and **blast furnace gas** in transformation and Iron and Steel final consumption for 2022 to avoid breaks in the time series.

In the 2024 edition, the IEA Secretariat estimated the **cooking coal** consumption on the coke ovens for the data year 2022 following the growth rate from the “Balance Nacional de Energía” published by the “Secretaría de Energía”. 
In the 2023 edition, the IEA Secretariat estimated the distribution of demand of **coke oven gas** and **blast furnace gas** in transformation, energy industry own use and iron and steel final consumption for 2021 to avoid breaks in the time series.

The category Non-specified (Industry) in the **coking coal** balance includes the industries of transport equipment, chemical, food and glass. Disaggregated values are not available.

Use of pulverised coal injection in blast furnaces occurs in Mexico, but is not currently reported.

Oxygen steel furnace gas production and production of **other recovered gases** occur as by-products of heavy industry, but are not reported.

For **coking coal**, amounts reported for consumption in main activity electricity generation and associated imports for the years 2003 to 2016 have been reallocated to **other bituminous coal** by the IEA Secretariat.

**Oil**

**General notes**

In the 2023 edition, data from 2020 onwards are partly-estimated by the IEA Secretariat based on the IEA Monthly Oil Statistics, the Mexican Secretaría de Energía (SENER) national energy balance and the submission by the Mexican administration during the 2022/23 cycle.

In the 2022 edition, data from 2018 onwards are partly-estimated by the IEA Secretariat based on the Monthly Oil Statistics and the Mexican Secretaría de Energía (SENER) national energy balance.

In the 2021 edition, the 2018 and 2019 data are partly-estimated by the IEA Secretariat based on the Monthly Oil Statistics and the Mexican Secretaría de Energía (SENER) national energy balance.

In the 2016 edition, major revisions were carried by the Ministry of Energy on the time series back to 1990 based on updated information available from PEMEX, the Mexican Institute of Petroleum and the Federal Electricity Commission (CFE). Revisions include notably crude production, refinery output, gas separation plant production, autoproducer generation and road consumption.

New data reported as additives from 1990 correspond to methyl tertiary butyl ether.
From 1993, data for production from other sources (natural gas) of other hydrocarbons correspond to hydrogen used at the Minatitlán refinery, also represented as the output of non-specified transformation in the balances format.

The split between domestic and international aviation consumption of kerosene-type jet fuel is not available. By default, all kerosene-type jet fuel consumption is reported under international aviation.

**Supply**

In 2017 Minatitlán refinery was offline for several months and later operating well below capacity as a result of an accident on site. The refinery at Tula was also temporarily offline. Both these events impact refinery throughput in 2018.

Refinery intake of crude oil was estimated by the IEA Secretariat for the years 2016, 2017 and 2018 based on growth rates from SENER and PEMEX published data.

In 2017, production of crude oil and NGL was impacted by heavy maintenance at the Ku-Maloob-Zaap field and decline at the Cantarell field in the Gulf Mexico which was affected by several force majeure events.

For 2017 import data of LPG, naphtha, road diesel and fuel oil, the received data was supplemented with estimates by the IEA Secretariat based on published data from SENER.

2017 to 2022 imports of petroleum coke were estimated by the IEA Secretariat based on information from the U.S. Energy Information Agency and the national energy balance.

From 2016 onwards trade information is based on daily customs data now available to the Ministry of Energy. Historical revisions are pending.

The large refinery losses from 2005 onwards are the result of the downward revisions to refinery output of gas/diesel oil carried out in 2017.

NGL production reported in the IEA publications may be different from what is reported in the Mexican energy publications as the IEA includes in its oil data liquids produced in conjunction with natural gas.

In the 2016 edition, main revisions were carried to NGL, LPG, naphtha, ethane supply. New data became available on input of NGL to refineries prior to 2011. Data on ethane production from gas separation plants (positive transfers from
NGL) was revised upwards for 1990 to 1998. LPG gas separation plant production was revised down. Naphtha refinery output was revised upwards from 1990.

Transformation

2020 to 2022 inputs to natural gas blending plants were estimated based on the national energy balance.

For several months in 2017, the Salina Cruz refinery was under extensive maintenance following operational problems and structural damage as a result of the September 2017 earthquake.

The Madero refinery closed for maintenance in August 2017 and remained close through the start of 2018.

2017 refinery gross output of gas/diesel oil, bitumen, lubricants and paraffin waxes was estimated by the IEA Secretariat based on SENER and PEMEX published data.

In the 2016 edition, data for crude oil refinery input and refinery output of gas/diesel, naphtha, refinery gas, bitumen, paraffin wax and other products were revised back to 1990 (see general notes).

Data for fuel oil and gas/diesel inputs to autoproducer CHP generation are available from 1999.

In 2003, a new facility was added to a refinery to produce petroleum coke.

Consumption

2017 consumption of naphtha for feedstock purposes in the chemical and petrochemical sector was estimated by the IEA Secretariat based on ethylene production figures.

Consumption of motor gasoline and road diesel was impacted by changes to fuel subsidies introduced on January 1, 2017.

Consumption of lubricants and bitumen for 2017 was estimated by the IEA Secretariat based on sales data from SENER.

In the 2016 edition, naphtha non-energy use consumption in the chemical/industry was revised significantly revised down from 1990 to 2008 based on PEMEX information.
In the 2016 edition, gas/diesel and motor gasoline road consumption data were revised back to 1990 based on updated information from the Mexican Institute of Petroleum and PEMEX.

Consumption of lubricants, bitumen and paraffin waxes are available from 1990 and petroleum coke from 1993.

Prior to 1987, the split of LPG consumption between residential and commercial/public services has been estimated by the IEA Secretariat.

### Natural gas

**General notes**

Supply data for 2021 and 2022 are partly estimated by the IEA Secretariat.

Natural gas reported in the IEA publications may be different from what is reported in the Mexican energy publications, as IEA includes only dry gas and excludes natural gas liquids, which are considered as part of oil.

**Consumption**

Losses and pipeline transport have been included in oil and gas extraction.

From 1993 to 1999, part of energy industry own use and non-specified industry data were estimated.

Since 1993, the breakdown of the energy sector and of other sectors is available.

### Biofuels and waste

**General notes**

For the 2020 July edition, new data supplied by the Mexican administration for 2018 and 2019 were incorporated in place of previous estimates.

The Mexican administration believes the fuels categorised as industrial wastes (non-renewable) are likely residual gas, however more investigation is needed. Revisions, if applicable, are expected next cycle.
Supply
Prior to 2017 data, some bagasse production has been attributed to other vegetal materials and residues. This causes a break in series between 2016 and 2017. Revisions prior to 2017 are expected in the future.

Data for bagasse production are available from 2008.

Transformation
In the 2024 edition, main activity producer electricity input and output and autoproducer electricity use of primary solid biofuels for 2022 have been estimated by the IEA Secretariat based on information from the national energy balance 2022 published by the Secretaria de Energía (SENER).

Consumption
Increased consumption in the industry and transformation sectors for solid biofuels in 2017 is attributed to bagasse.

Data for solid biofuels used in autoproducer electricity plants from 1991 to 2005 have been estimated by the Mexican administration.

Data on biogases consumption are available from 1997.

Electricity and heat

General notes
In the 2023 and 2024 edition, some 2021 and 2022 data were estimated by the IEA Secretariat based on the Balance Nacional de Energía 2021, and other sources.

In the 2023 edition, data for 2018-2020 were revised based on new data provided by the Mexican administration.

For the 2022 edition, due to data availability issues, some data provided by the Mexican administration for 2020 were equal to the values for previous years.

For the 2020 July edition, new data supplied by the Mexican administration for 2018 and 2019 were incorporated in place of previous estimates.

The Mexican administration is currently undertaking revisions of the electricity time series back to 1996. Revisions include changes on inputs and outputs on power plants fuelled mainly by combustible fuels and the reclassification of main...
electricity plants previously reporting **sub-bituminous coal** as fuel to **other bituminous coal** for the period 2003-2015.

**Supply**

Electricity generation from **other sources** mainly represents generation from recovered waste heat from industry, and also a small amount of electricity production from regenerative braking in suburban trains.

The decrease in electricity produced from **wind** in 2017 is due to an earthquake which damaged infrastructure in the south of the country.

Production of main activity producer electricity plants from **wind** is available from 1994.

Electricity production from **wind** and **solar photovoltaic** is available from 1990.

Discrepancies occur between respective reported figures for electricity trade between the US and Mexico from 2013 onwards.

**Transformation**

New autoproducer electricity plants fuelled with **coke oven gases** were put online in 1999.

Electricity production from **solid biofuels** and **biogases** data are available respectively from 1991 and 1997.

**Consumption**

Some electricity consumption in energy industry is included in the industry sub-sector where it was generated (e.g. the chemical industry, as well as in **non-specified industry**).

Direct use of **solar thermal** heat is available from 1990.
Netherlands

Source

General notes

The Netherlands Central Bureau of Statistics has conducted reviews and revisions of their energy balance three times; in 2005, 2011 and 2015. The 2005 revisions were to improve basic energy statistics, particularly with respect to carbon and CO₂ reporting, while the 2011 revisions were part of a harmonization program with international energy statistics. The 2015 revisions were the result of increased data collection, availability of new source information, and further alignment with international energy definitions. More details are available here: www.cbs.nl.

Coal

General notes

International trade into and through the hub ports of Amsterdam and Rotterdam is complicated by the capacity to purchase coal directly at these points. The majority of coal passing through these ports is intended for consumption in European countries other than the Netherlands, which is neither the country of origin or destination, therefore these data have been removed where possible. In the 2019 edition, the Central Bureau of Statistics proceeded to major revisions of trade and stock changes for anthracite, coking coal, other bituminous coal and lignite since 1990. Imports now should only relate to coal for inland consumption according to Eurostat’s statistical regulation, thus eliminating transits to other countries and stock changes of trading companies.

In the 2023 edition, there were small revisions of production, trade, transformation and final consumption flows for several products between 2015 and 2020, due to improved statistical methodology and new available information.

Following revisions made in the previous edition to data for 1995 onwards, this edition includes further revisions made by the Dutch administration for the period 1990 to 1994. These revisions are the result of increased data collection, availability of new source information, and further alignment with international energy standards.
Supply

In the 2023 edition, some imports and the blast furnace (transformation) consumption of anthracite for 2012 and 2013 were re-allocated to coking coal, due to new information available.

In the 2013 edition, non-specified exports for 2011 were estimated by the Central Bureau of Statistics due to a lack of information from key market players.

For data prior to 2011, stock changes for primary coal types were estimated by the Dutch administration based on trade and consumption data.

For 1984 to 1986, production from other sources of other bituminous coal represents a stock of “smalls” washed for re-use.

Transformation

In the 2023 edition, the Dutch administration extended the revisions of blast furnaces, coke ovens and iron and steel flows back to 1990. These affected coke oven gas and blast furnace gas energy industry own use and final consumption in iron and steel industry.

In the 2022 edition, revisions back to 2015 were made in the reporting of blast furnaces, coke ovens and iron and steel industry, due to improved observations of an industrial complex.

At the end of 2015 three low-efficiency plants running on bituminous coal input closed down. In the course of 2017 another two old installations ceased operating. These closures were part of the so-called Agreement on Energy for Sustainable Growth in the Netherlands agreed upon by the Social and Economic Council of the Netherlands (SER) and more than forty representative organisations and stakeholders.

Consumption

In 2019, the consumption of lignite decreased significantly as result of a company partly ceasing activities. That company totally ceased its activities in 2020.

Prior to 1989, non-energy use is included with industry consumption.
Oil

General notes

In 2017, large amounts of fuel oil were reclassified as other products due to their chemical properties.

Data for gas/diesel road consumption become more difficult to collect in 2013, as the distinction in taxation between road diesel and gasoil was abolished.

Following revisions made in the previous edition to data for 1995 onwards, this edition includes further revisions made by the Dutch administration for the period 1990 to 1994. These revisions are the result of increased data collection, availability of new source information, and further alignment with international energy definitions.

Motor gasoline includes other light oils until 1990.

Some breaks in time series occur in 1990 when the Dutch administration started to report the petrochemical industry according to IEA methodology.

From 1990 onwards, naphtha includes aromatics, naphtha and other light oils.

Supply

Trends in the supply of other oil products in 2020 are confirmed by the Dutch administration to be the result of companies sometimes reporting highly-aromatic fuel oil into this category.

In the 2021 edition, stock changes of bitumen for 2018 and 2019 are estimated by the IEA Secretariat.

Data for deliveries of fuel oil to international marine bunkers were revised downwards in the 2019 edition back to 2015. This was due to an improvement in the underlying data and figures available to CBS Statistics Netherlands.

In 2017 the main plant producing lubricants closed as a result there is no more refinery gross output of this product.

Consumption

In the 2023 edition, the Dutch administration introduced several revisions back to 1990, in particular for gas/diesel oil sectoral inland consumption. The bottom-up analyses were done on the basis of new research of this oil product’s use by mobile equipment.
Consumption of fuel oil for fishing in 2020 is zero as fishing boats switched to gas/diesel oil.

In the 2019 edition several revisions were introduced to flows relating to the chemical and petrochemical industry. Energy consumption in the chemical industry has been revised upwards back to 2012, following an internal audit of the data that revealed gaps in coverage. Non-energy consumption in the chemical industry has been revised downwards back to 1990 following a review of the data submitted by one of the main companies.

Refinery gas includes chemical gas and is included in chemical industry consumption.

**Natural gas**

**General notes**

In the 2018 edition, the Dutch administration revised the supply side data for 1990-2016 in order to (i) better account for flows from underground storages which used to be incorporated in the indigenous production data, and also (ii) handle inflows/outflows of natural gas stored in Germany as imports/exports.

In the 2019 edition, the Dutch administration revised the opening and closing stock levels based on a dedicated questionnaire used. Additionally, industrial consumption was revised since 2012 based on inputs coming from the Emissions Trading Scheme (ETS) data.

Between 1981 and 1982, and between 1983 and 1984 there are breaks in time series due to the introduction of more comprehensive surveys on end-use consumption.

**Supply**

*LNG Imports* data are obtained directly from customs by Statistics Netherlands, as a result there may be the reporting of imports from countries which do not produce natural gas.

In the 2023 edition, trade methodology was updated to eliminate the reporting of transit trade with Belgium, this has resulted in a break in the time series between 2016 and 2017.
In 2015 and 2016, there are reported imports and exports to/from Netherlands. This gas comes from underground storages located in neighbouring countries. This data will be revised in the next data cycle to eliminate this confusing reporting.

A production cap of natural gas was set by the government in 2015, which has been extended and gradually tightened for 2016, 2017 and 2018.

In the past, the amounts reported under indigenous production also included quantities coming from stock changes. The reason was that the Dutch administration could not distinguish between quantities of natural gas falling under marketable production and amounts being moved from offshore fields to onshore fields without undergoing any purification and/or other necessary production processes. From 2015, the data reported distinguish between amounts to be reported as production and amounts that should be classified as stock changes.

International marine bunkers were reported for the first time in the 2019 edition.

**Transformation**

Data for non-specified (energy own-use) represent natural gas combusted by the distribution operator for the purpose of operating the gas distribution grid.

The 2009 increase in input to main activity electricity producer consumption is due to the opening of a new plant in the second half of 2008.

**Consumption**

Data for the non-specified (other) non-energy use represent the volume of gas injected as cushion gas in a new underground storage.

**Biofuels and waste**

**General notes**

In the 2024 edition, the Dutch administration revised several flows and products from 2015 due to both new available information and changes in their data extraction processes.
Supply

In the 2024 edition, production of other vegetal materials and residues (part of solid biofuels) was revised by the Dutch administration for 2021 to ensure consistency with the data from the new biomass questionnaire. This causes a break in the time series between 2020 and 2021, but the same approach is likely to be extended back to 2015 data in the next cycle.

Increases in biodiesel production for 2017 are related to increased capacity of existing plants and increased demand.

From 2009 to 2012, and again from 2014 the production and trade of pure biogasoline were confidential; net imports were estimated by the Dutch administration based on consumption.

Transformation

The imports of wood pellets are up in 2018 due to the renewed subsidy for co-firing of biomass at energy plants.

In 2017, the increase in heat production from solid biofuels in main activity CHP plants is because there were two additional companies reporting data.

Trade data for municipal waste are available from 2011.

Consumption

In the 2020 edition, there was a revision from 1990 to 2017 of the consumption of solid biofuels in the residential sector.

From 2014, a better allocation of heat own-use was available for biogas digester prewarming, and in municipal waste burning plants for flue gas cleaning.

The final consumption of solid biofuels in the residential and agriculture sector increased in 2014 and again in 2016 due to the results of new surveys and parameters.

Electricity and heat

General notes

In the 2016 and 2017 editions, data for the years 1990-2013 were revised by the Dutch administration following an extended review of old national publications and new data obtained from grid operators.
Supply

In 2019, the Dutch administration revised transmission and distribution losses of heat back to 2015 to incorporate improved data. As a result, there a break between 2014 and 2015. Historical revisions are pending.

For 2018, the increase in electricity output from Solar PV autoproducer electricity plants is in part due to the inclusion of solar on industry surveys. As a result autoproduction in various industries was captured for the first time.

For 2018, the declines in heat generation from municipal waste, and heat used for electricity generation, and also the increase in electricity output from municipal waste, are due to a change in ownership of a company which sold heat.

Data on heat production from chemical sources are available from 2017.

The decrease in electricity production from nuclear power in 1997, 2013, and 2017 is due to maintenance shutdowns at the Netherlands’ only nuclear power plant.

Electricity from other sources represents generation from expansion gases and chemical waste gases.

The large increase in electricity trade in 1999 is due to the liberalisation of the Dutch electricity market. Until 2003, trade data are based on contracted quantities instead of physical flows.

The increase of heat produced in main heat plants in 1995 is due to a change in ownership of one large installation, resulting in its reclassification from being an autoproducer to a main activity plant.

Electricity production from solar photovoltaic is available from 1990.

Transformation

For 2019, the increases in electricity output from other sources, and heat output from chemical heat are in part due to improved data availability.

Data on electricity and heat output from industrial waste are available from 2015.

In mid-2017, two other bituminous coal-fired power stations closed, as a result output from other bituminous coal declined in 2018. Another plant closed in-late 2019.
The efficiency of blast furnace gas-fired autoproducer CHP plants increases between 2015 and 2016 due to improved methods for allocating inputs between sold and unsold heat.

Heat output from chemical heat, and other sources is available from 2015.

Electricity output from other sources refers to production from expansion gases and recovered heat.

Heat used for electricity production represents waste heat bought from other industries that was generated from combustible fuels. The corresponding electricity output is included with that of natural gas.

Autoproducer heat plants using refinery gases are included with autoproducer CHP plants because data are considered confidential for 1990.

Heat production in commercial and public services includes production in agriculture.

All municipal waste autoproducer electricity and heat only plants have been reclassified by Statistics Netherlands as autoproducer CHP from 2012, causing breaks in the time series.

Prior to 2008, a few small autoproducer electricity plants using solid biofuels were included with main activity plants for reasons of confidentiality.

In 2006, some municipal waste plants changed ownership and were reclassified from electricity only to CHP plants as they started heat projects.

A new main activity producer CHP plant fuelled by refinery gas started up in 1999 and there was a fuel reclassification in 2000.

For natural gas, all electricity production prior to 1998 is included in CHP plants.

For biofuels and waste, all electricity and heat produced prior to 1995 is included in CHP plants.

Data for heat produced from biofuels and waste are available from 1990.

Prior to 1990, all electricity and heat produced from coal is included in CHP plants.

Inputs of hard coal for electricity production from 1981 to 1989 in terajoules (TJ) are estimated by the Secretariat based on data submitted in kilotonnes (kt) by the Dutch administration.
Net electricity production by autoproducers prior to 1988 includes production from **combustible fuel** sources only.

Data for **heat** production by fuel in heat plants prior to 1987 are estimated by the Secretariat based on fuel inputs submitted by the Dutch administration.

Data for **heat** production from main activity producer CHP plants and heat plants are available from 1982.

Prior to 1982, **electricity** production from and inputs to main activity producer CHP plants are included with main activity producer electricity plants.

For 1970 to 1973, **electricity** output from autoproducer CHP plants has been included with main activity producer CHP plants.

**Consumption**

In the 2023 edition, the Dutch Administration revised data for electricity consumption in the **Blast furnace** and **Iron and steel** sectors for the period 1990-2014. This followed revisions to data for 2015-2019 in the 2022 edition.

In 2018, the decrease in **heat** used for electricity generation was due to the closure of a large installation.

In 2018, there were four new **geothermal** installations producing heat which warmed greenhouses. As in the past, these would be categorised in the **agriculture and forestry** sector.

For data from 2015 onwards, there is improved data availability for **heat**. This causes breaks in series for **transmission and distribution losses**, and heat consumption in the **non-ferrous metals** sectors.

Increasing **electricity** consumption in **agriculture and forestry** is due to expansion of greenhouse farming.

Direct use of **geothermal heat** in agriculture/forestry starting in 2008 is due to a new project extracting deep **geothermal** heat. The heat produced has been used for heating greenhouses.

Prior to 1979, **electricity** consumption in agriculture is included in commercial and public services.
New Zealand

Source

Ministry of Business, Innovation and Employment, Wellington.

General notes

Coal

General notes

In the 2023 edition, the calorific values of sub-bituminous coal for all flows were revised by the New Zealand administration for 2019 and 2020, due to a correction in the reporting methodology of one major producer.

In the 2021 edition, the New Zealand administration provided revisions for some flows back to 2009.

In the 2020 edition, the New Zealand administration has done historical revisions on the data as a new data system and methodology was implemented.

In the 2020 edition, some high statistical differences can be found for many types of coal in various time periods.

Peat, although produced in New Zealand, is not used as a fuel, and is used for agricultural purposes only.

In the 2014 edition, the definition of hard coal was aligned with the International Recommendations for Energy Statistics. Prior to this, hard coal for New Zealand from 1960 to 1977 had contained sub-bituminous coal. The portion of sub-bituminous coal production and residential consumption has been estimated by the IEA Secretariat for this period and moved to brown coal.

In the 2011 edition, the New Zealand administration has revised some of the coal, natural gas, oil, renewable and electricity time series back to 1990.

Supply

In the 2021, a mine was reclassified from other bituminous coal to sub-bituminous coal. The time series was revised accordingly.
In 2018 a mine of other bituminous coal that was not in production in 2017 restarted activity.

In 2017 the underground mine producing coking coal switched to opencast operation.

The decrease of other bituminous coal production in 2015 is due to a temporary shutdown in one of the coal mines at the beginning of 2015 and another one at the end of 2015.

A detailed breakdown of exports of coking coal by country of destination between 2001 and 2011 is estimated by the IEA, based on secondary sources and partner data.

Transformation

Sub-bituminous coal inputs into coke ovens refers to coal that is merged with iron sands and limestone to form the inputs for the multi-hearth-furnaces, kilns and melters that produce direct reduced iron (Glenbrook Steel Site), with off-gases and supplemental and natural gas driving CHP plants. This method, while not the typical iron and steel process, produces similar by-products. The sub-bituminous coal inputs are reported under coke oven coke transformation and the resulting off-gases are reported as production of coke oven gas and blast furnace gas.

Blast furnace gas production and distribution losses prior to 1998 are IEA Secretariat estimates. Portions of this gas will have been used for energy purposes in the multi-hearth furnaces or elsewhere in the plant. Some transformation efficiencies will appear higher than normal due to non-reporting of certain inputs, including some confidential data.

Consumption

In the 2020 edition, some quantities of sub-bituminous coal that were previously reported under other bituminous coal were moved under sub-bituminous coal. This reclassification led to a break in the consumption time series between 2018 and 2019 as the new classification starts in 2019.

In 2018, some other bituminous coal quantities previously reported under non-specified were reallocated into industry sectors.

In final consumption, some industry data are reported in non-specified industry for confidentiality reasons.
In 2014, the increase in consumption of sub-bituminous coal in mines included the combustion of some unsold coal fines for safety reasons.

Prior to 2010, the construction sector is included with commercial/public services.

Prior to 2009, mining and quarrying is included in agriculture.

Oil

General notes

In the 2023 edition, breaks in the time series appear between 2020 and 2021 for several oil products as a result of a change in methodology made by the New Zealander administration, affecting most notably refinery output, trade, stocks and sectoral demand. Historical revisions are expected next cycle.

In the 2021 edition, breaks appear between 2018 and 2019 for other oil products as a result of improved reporting infrastructure by the New Zealander administration.

For 2016, the following data were estimated by the IEA Secretariat: consumption of lubricants; imports of bitumen; and refinery output, and interproduct transfers of other oil products.

For 2015, the following data were estimated by the IEA Secretariat: stock changes and consumption of lubricants; consumption of bitumen, and all figures for petroleum coke and other oil products.

Until 1997, other hydrocarbons from natural gas sources correspond to synthetic gasoline production (ceased in February 1997).

For reasons of confidentiality, beginning in 1994, the New Zealand administration no longer reports data on the production of methanol.

Supply

In the 2022 edition, receipts from renewables of biodiesel for blending with transport fuels are not available for 2019 and 2020 according to the New Zealander administration. This can result in unexpected supply values. Revisions are expected next cycle.
In the 2021 edition, the New Zealander administration revised stock changes for several primary and secondary oil products for as early as 2014 onwards.

In 2019, New Zealand no longer produces lubricants.

Between 2013 and 2014, the jump in imports of kerosene-type jet fuel can be explained by an anticipated strike at the refineries.

Transformation

In 2020, gas/diesel oil inputs for electricity production are confirmed by the New Zealander administration to be higher than usual due to generator testing. Furthermore, input of gas/diesel oil for CHP production in 2020 is zero.

Consumption

In the 2023 edition, the IEA Secretariat estimated the consumption of motor gasoline and gas/diesel oil in domestic navigation and residential sectors in 2021. Quantities in domestic navigation include oil products purchased at service stations and used for recreational marine purposes.

Between 2009 and 2010, a break in time series appears for demand of gas/diesel as the administration changed its methodology for commercial/public services.

For 1960 to 1973, consumption data have been estimated by the Secretariat.

Natural gas

General notes

2018 data were estimated based on monthly data submitted to the IEA Secretariat.

Supply

There are neither imports nor exports of natural gas for New Zealand.

Transformation

The large 1998 increase in input to autoproducer CHP plants is due to two new autoproducer CHP plants.

In February 1997, production of synthetic gasoline from natural gas ended.
Consumption

Between 2012 and 2013 there are breaks in time series for the final consumption breakdown due to the introduction of a new survey.

In 2005, the decline in chemical and petrochemical industry consumption was due to the closure of the Motunui methanol production plant, which was then reopened in late 2008.

Prior to 2003, gas consumed in industry includes some gas for energy industry own-use. Since 1990, detailed consumption breakdown for industry is available. From 1977 to 1979 and from 1986 to 1989, losses are included in statistical differences.

Biofuels and waste

General notes

In the 2024 edition, the New Zealand administration revised supply and final consumption of primary solid biofuels and added charcoal data for the entire time series, due to new available information.

In the 2020 edition, extensive revisions were made for the time series back to 1990. The majority of the revisions were related to transiting the New Zealand data system from excel based to R based.

For the 2019 edition, the New Zealand administration submitted extensive revisions back to 1990 following an internal review of their systems and methodologies.

Due to improved wood data collection starting with 2016 data, increases in solid biofuels in transformation, supply and consumption may not be a true increase but more representative of increased data survey respondents. This results in a break in time series between 2015 and 2016.

Transformation

In the 2022 edition, data on fuel input and electricity generation from solid biofuels CHP auto-producers were revised thanks to a multi-year programme of work that the administration undertook to improve solid biofuels statistics.
In the 2019 edition, data on electricity production from biogases were significantly revised by the New Zealand administration following an internal review of systems and methodologies.

Consumption

In the 2020 edition, the repetition of data is an estimate by the New Zealand administration for the consumption of biogases in the food, beverages and tobacco sector for the years 1990 to 2018 due to unavailability of data. The same is true for the consumption of biogases in the commercial and public services sector from 2007 to 2018.

Electricity and heat

General notes

For the 2020 and 2019 editions, the New Zealand administration submitted extensive revisions back to 1990 following an internal review of their systems and methodologies. For solar PV, the source data, Electricity Market Information, changed their entire time series. Data may be further revised in future editions.

There are several breaks in the time series between 1987 and 1988 due to a reorganisation of government departments during 1987.

Supply

Heat outputs from main activity and autoproducer CHP plants are not available.

Electricity and heat production from other sources represents waste heat recovered and used for electricity production. This includes heat recovered from chemical processes at acid plants in the fertiliser industry, where sulphur is the main input.

Only net electricity production is collected for some plants such as combustible fuels autoproducer CHP and electricity plants. As a result, electricity own use in these plants is estimated by the New Zealand administration.

Transformation

For 2018, a shortage of natural gas resulted in decreased use of natural gas for electricity generation, and increased use of sub-bituminous coal.
In late 2015, two natural gas fired power stations used for baseload demand closed. As the remaining natural gas-fired plants are used more for peak demand, there is a reduction in generation efficiency between 2015 and 2016.

Stable efficiencies are reported for a range of fuels and plant types based on historical estimates by the New Zealand administration including biogas autoproducer chp and electricity plants, gas/diesel oil main activity producer CHP and autoproducer chp plants as well as natural gas autoproducer electricity plants.

In 1999, a reclassification of autoproducer plants causes some breaks in the time series.

Data for geothermal electricity production by autoproducers are available from 1990.

The New Zealand administration has updated efficiencies for electricity production from geothermal heat from 10% to 15% from 1990 onwards; this causes a break in the time series between 1989 and 1990.

In the 2018 edition, revisions in electricity production in hydro plants back to 2002 are related to a change in methodology. This results in a break in time series between 2001 and 2002.

Electricity production by autoproducers from natural gas and from oil has been estimated by the Secretariat from 1970 to 1973.

Consumption

The only remaining oil refinery closed during 2022.

A new survey starting with the 2013 data can cause breaks in data for final consumption of electricity.

The consumption of electricity by the transport sector is collected under the Australian and New Zealand Standard Industrial Classification (ANZSIC) 2006 system’s “Transport, Postal and Warehousing” category. As this covers commercial services as well as transport, MBIE estimates the amount of this that can be allocated to transport. At present this data does not allow for the disaggregation by transport sub-sector.

Beginning in 2013, the falling electricity consumption in the pulp, paper and printing sector follows with the permanent closure of a paper machine in one of New Zealand’s larger energy users, following decreased demand for newsprint.
Data on direct use of **geothermal heat** are available from 1990 and direct use of **solar thermal heat** from 2002.

From 1974 to 1993 **transmission and distribution losses** include statistical differences.

The classifications used by the administration of New Zealand were changed in 1991.

**Electricity** consumption in **pulp, paper and printing** is included in **wood and wood products** prior to 1990.
Norway

Source
Statistics Norway, Oslo.

General Notes
In the 2018 edition, data for Norway were revised back to 2010, following the introduction of a new system for energy balances and energy accounts. Breaks in series may appear between 2009 and 2010 as a result. For more detailed information regarding the methodological changes, please refer to the documentation of statistics production since statistics year 2010 on the Statistics Norway website. At the time of writing, the document was available in Norwegian as “Dokumentasjon av statistikkproduksjonen fra statistikkår 2010 og fremover”.

Coal

General notes
Other bituminous coal includes lignite.

Production of coking coal, coke oven coke and coke oven gas ceased in the late 1980s.

Supply
In 2022 a large blast furnace gas producer that did not operate in 2020 and 2021 restarted production and sales of blast furnace gas.

A downward trend of other bituminous coal production started in 2017.

The decrease of other bituminous coal production in 2015 is due to a temporary shutdown in one of the coal mines.

The decrease of other bituminous coal production in 2005 is due to a fire in one of the coal mines; this entailed a break in the production for a large part of the year.

Consumption
In 2022, a company restarted operating of a blast furnace after the closure in 2020 and sold part of the produced blast furnace gas to the chemical industry.
Oil

General notes

In the 2022 and 2023 editions, as part of the continuing efforts for data improvement, the Norwegian administration introduced revisions back to 2010 due to methodological changes and new sources. There may be breaks for some products and flows between 2009 and 2010. Additional revisions are expected in the next edition.

In the 2021 edition, in continuation of the efforts related to the new system for energy balances and energy accounts introduced in the previous edition, the Norwegian administration further revised back to 2010. Additional revisions are expected in the next edition.

In the 2018 edition, the Norwegian administration made widespread revisions to their data back to 2010, following the introduction of a new system for energy balances and energy accounts. Breaks in series may appear between 2009 and 2010 as a result.

Prior to 1990, ethane is included with LPG.

Supply

In the 2023 edition, the Norwegian administration introduced revisions back to 2010 for indigenous production and exports of crude oil. There may be breaks between 2009 and 2010.

Due to refinery maintenance, refinery output of several oil products decreased in 2019.

In the 2021 edition, indigenous production of additives/oxygenates decreased due to a change in reporting methodology by the Norwegian administration.

In 2017 the Goliat field was offline from September through October for planned and unplanned maintenance.

Crude oil production includes condensates.

Starting with 2014 data, Statistics Norway has changed the source for annual crude oil exports to include shipping information collected by the National Petroleum Directorate.

Starting from 2014 data, there is a break in naptha supply time series due to a change in reporting methodology adopted by Statistics Norway.
Prior to 2002 data, a part of LPG exports was reported as NGL exports.

Since 1986, imports of refinery feedstocks are reported under the relevant oil product imports.

**Transformation**

In 2016 the Slagen refinery underwent maintenance which led to a decrease in refinery throughput for that year.

In 2014, the strong decrease in crude oil refinery intake is linked to heavy maintenance work carried in the refineries in fall 2014.

Starting with 1990 data, gas/diesel oil used for autoproduced electricity on oil and gas platforms are reported under energy industry own use.

From 1970 to 1975, gas/diesel oil for electricity generation has been estimated by the Secretariat.

**Consumption**

Starting in 2021, it is mandatory in Norway to blend biodiesel to non-biodiesel for use within non-road transport sectors.

In the 2022 edition, the Norwegian administration revised consumption data for several sub-sectors, most notably for gas/diesel oil, motor gasoline and kerosene type jet fuel, from 2020 onwards.

Use of oil products for heating in households is no longer allowed; hence, the consumption of oil products in the residential sector declined in 2019.

Data on naphtha consumption in Norway are currently unavailable.

Consumption of lubricants is reported within industry, as no further breakdown is available.

In 2003 and 1993 data, breaks in time series appear for consumption in the chemical/petrochemical industry due to newly available information.

Prior to 2000, gas/diesel oil used in fishing is included in agriculture/forestry.
Natural gas

General notes
For Norway, the supply of natural gas is the residual of two very large and opposite amounts: indigenous production and exports. As a result, large statistical differences in some years may lead to discrepancies in the growth rates of supply and demand of natural gas.

Supply
Since 2008 data on opening and closing stock levels are available.

Transformation
In the 2023 edition, revisions were made from 2010 to 2020 which re-allocated oil refineries to electricity, chp, and heat which aligns with the correct reporting methodology.

Since 2007, natural gas inputs to all electricity and CHP plants are included in autoproducer electricity plants for confidentiality reasons.

The last main activity electricity producer closed down in 2016.

Consumption
Prior to 2008, natural gas amounts used in gas extraction by offshore platforms were not included in production data.

Since 2002 domestic navigation is included under non-specified transport.

The 2007 increase in non-specified transport is due to the wider use of gas-powered sea vessels.

Before 2000, energy use in oil and gas extraction also included some final consumption amounts.

In 1992 the increase in oil and gas extraction is due to the start-up of new fields.

Consumption for pipeline transport is included in energy industry own use.
Biofuels and waste

General notes
Some of the data reported under solid biofuels excluding charcoal includes charcoal. Efforts are being made by the Norwegian administration to separate this data in the future.

Due to new available information, in the 2024 edition the Norwegian administration revised several supply and demand flow from 2018 to 2021 and electricity production from main activity and auto producers for 2020 and 2021 for industrial waste, municipal wastes, primary solid biofuels, biogases, biodiesel, other liquid biofuels, hydro and solar PV.

Prior to 2007, equal shares of renewable and non-renewable municipal waste were estimated because the actual split was not known.

Data for industrial waste and biogases are available from 1991.

Supply
The data for the indigenous production of biogases is based on consumption data.

In 2014, the biodiesel production facility closed.

Data for liquid biofuels imports are available starting in 2006.

Transformation
Increased heat production from biogases and other liquid biofuels in 2018 is related to replacing fossil fuels.

Consumption
In the 2024 edition, for the first time the Norwegian administration reported biogases blended in the natural gas grid for 2022 and consumption of liquified biomethane added to LNG for maritime transport in 2019 and 2022.

In the 2024 edition, the amount of biogases reported for commercial and public services in 2022 is likely to be too low and will be revised by the Norwegian administration in the next publications.
Charcoal consumption data in residential were first reported in the 2022 edition, only for the preliminary 2021 data, and then for the whole time series in the 2023 edition.

From 2019, data for solid biofuels in the industry sector replaces coal/coke as a reductant. This is seen in the chemical/petrochemical and iron and steel sectors.

Decreases in the consumption of solid biofuels in the chemical/petrochemical, non-metallic minerals and food, beverages and tobacco in 2018 are related to the fact that charcoal was included before but now it has been deducted.

Distribution losses for biogases are included in commercial/public services prior to 2003.

Electricity and heat

Supply
In the 2023 edition, the Norwegian Administration revised heat production from heat pumps and other sources, for the years 2010-2017, to remove amounts used for district cooling.

Solar electricity production in the residential sector is available from 2018. However, it only refers to electricity sold – it does not include electricity generated and consumed by households themselves.

The electricity generated from other sources represents electricity from waste heat.

Prior to 2009, transmission and distribution losses include statistical differences.

Heat produced by autoproducer heat plants from chemical processes and from other sources and used for electricity production has been estimated by the IEA Secretariat for the period 1990 to 2006.

Electricity production from wind is available from 1993.

Data for heat production from heat pumps and electric boilers (including the electricity used for this production) are available from 1989.

Data for heat production are not available prior to 1983.
Transformation

In September 2020, a fire occurred at a natural gas fired power plant. As a result, lower electricity output from natural gas was observed in 2021 and early 2022.

Prior to 2018, heat output from heat pumps included district cooling. Electricity inputs to heat pumps run in cooling mode is included for all years. Revisions are pending.

Increased heat production from biogases and other liquid biofuels in 2018 is related to replacing fossil fuels.

For 2017, the apparent increase in heat output from solid biofuel-fired Main CHP plants is due to a plant reclassification.

In the 2016 edition, Norway corrected the industrial waste consumption in heat plants, and reclassified some of the corresponding heat output under other sources.

Starting in 2007, data for natural gas electricity and CHP plants are aggregated in autoproducer electricity plants for confidentiality reasons. The revisions received for the 2018 edition partially altered these data for the period 2010 to 2016, but no explanations were given.

Breaks in the time series between 1996 and 1997 and between 2001 and 2002 and now 2009 and 2010 are due to a reclassification of main activity producers and autoproducers. This includes the apparent cessation of autoproducer pumped hydro and hydro electricity generation since 2010, where this generation has been reclassified as main activity.

Data for heat production from biogases are available from 1995.

Prior to 1991, net electricity production by autoproducers by industry sub-sector was estimated by the Secretariat based on data submitted by the Norwegian administration.

Data on inputs and outputs in heat plants are not available prior to 1983 for main activity heat plants and prior to 1988 for autoproducer heat plants.

Consumption

Electricity consumption in road refers to calculated consumption for fully electric vehicles and hybrids. This consumption is removed from residential and commercial and public services consumption where relevant.
For the 2019 edition, heat consumption in the chemical (incl. petrochemical) and commercial and public services sectors was revised back to 2007. Historical revisions for other sectors are pending. As a result, breaks in series occur for heat consumption in some sectors between 2016 and 2017.

Consumption of electricity for pipeline transport is included in oil and gas extraction.

The breakdown of heat consumption by industry sub-sector was expanded in 1992, reclassified in 1994 and collected by a new reporting system in 1997.
Poland

Source

Central Statistical Office, Warsaw.

Coal

General notes

Other recovered gases which appear in the balances as output from blast furnaces also include off-gases from zinc and copper smelting, ceramics kilns and steel production, thus artificially increasing the overall efficiency of blast furnaces when calculated.

The decrease in exports and consumption of coking coal, as well as the stock built in 2019 are consequence of a reduction of the external and internal demand of iron and steel, which was impacted, among other factors, by the carbon and electricity prices.

Patent fuel trade data may include transit trade.

Prior to 2016 data, other bituminous coal includes anthracite.

Transformation

In 2019 the use of other bituminous coal for electricity generation decreased as consequence of high CO2 prices and high mining costs, which made more competitive other generation technologies such as natural gas or renewables, as well as electricity imports.

The decrease in the consumption of lignite in Main Activity Producer CHP Plants in 2019 is a result of the shutdown of a large power unit for renovation.

For the year 2015, there is production of gas works gas but no reporting of any input to that process. The LPG input was too small to be appeared (less than 0.5); until 2016, the reported numbers were rounded to the nearest whole number in the Joint Annual Questionnaires.

For the 2018 and 2019 editions, the Central Statistical Office has revised their methodology which accounts for sold heat produced from autoproducer heat plants using coking coal and other bituminous coal, resulting in lower, but more accurate data for 2007 onwards.
Consumption

In the 2022 edition, revisions were made in for 2017-2019 coke oven coke. This product is used as a reducing agent for the production of zinc concentrates. In previous years, it was treated as energy use. The values are currently shown as non-energy use.

Introduction of anti-smog resolution led to reduction of hard coal consumption in households in 2019.

Inputs of coke oven coke into blast furnaces and consumption in the iron and steel sector were estimated in 2019 so as to keep the efficiency of blast furnaces at 40%. Part of the large decrease in the iron and steel sector consumption can be explained by that estimation.

Consumption in agriculture/forestry for BKB, and own use in power stations for lignite are residual flows, so may contain statistical differences and other consumption not reported elsewhere. As a consequence, changes in these time series may not be wholly representative of the activities shown.

Prior to 2010, own use in coal mines included workers’ take home allowance, which should be included in residential consumption.

Oil

General notes

From 1997, receipts from other sources (natural gas) of other hydrocarbons correspond to the natural gas used in the hydrocracking unit in refineries, also represented as the output of non-specified transformation in the balances format.

Supply

Output of petroleum coke is produced from a new refinery plant installed at the end of 2019.

Between 2016 and 2017, a break in series for stocks of refinery feedstocks results from a change in reporting methodology.

In 2018 new legislation introduced a biofuel blending obligation for liquid fuels. The effects of this policy can be seen throughout 2017, as companies prepared for the implementation of the new directive, and in 2018 once the directive came into force.
Transformation

In 2017 lower refinery activity is linked to maintenance activities at several refinery installations across the country.

Prior to 1998, inputs of gas/diesel oil and heavy fuel oil to autoproducer CHP in petroleum refineries have been included in the transformation.

Consumption

In 2016 regulatory changes affecting the customs and tax authorities meant that consumption of fuel in the informal economy decreased.

In 2015, a new flue-gas desulphurisation unit was installed. As this unit facilitates high sulphur fuel oil burning in place of natural gas, this explains the increase in fuel oil consumption in oil refineries.

Natural gas

Supply

*Exports* include natural gas that is injected into underground storage facilities abroad. This process was very economically favourable for the years 2016 – 2020.

*Exports* include all the natural gas sold by companies operating in Poland (these are mainly re-exports).

Natural gas reported in *associated production* contains some heavier hydrocarbons. This results in a high gross calorific value for production.

Transformation

*Non-specified transformation* data represent natural gas used for hydrogen manufacture. This hydrogen is used for hydrodesulphurization in oil refineries.

In 2013 and 2014 some CHP plants were used as backup reserve plants, resulting in a decrease in consumption under main activity producers CHP plants.

In 2004 and 2005 small amounts of natural gas were used to start up main activity electricity plants.

In the 2017 data, local small-CHP & heat plants were reclassified from the commercial/public services to the transformation sector and the residential sub-sector.
Consumption

Distribution losses may include some statistical differences.

*Non-specified energy* includes gas used for heating and pumping operations in the distribution network.

Biofuels and waste

General notes

Several breaks in the industrial waste time series are caused by difficulties in the classification of wastes.

In the 2018 edition, solid biofuels were corrected for 2015 data.

There is a break in time series between 2015 and 2016 for biogases due to reclassification from autoproducer to main activity plants.

The increases in municipal wastes starting in 2016 are related to two new plants.

Data on biodiesels are available from 2005; biogasoline data from 2003; and other liquid biofuels data from 2009.

In 2008, a new questionnaire was launched which increased the coverage of renewable and waste data.

Supply

Under current Polish law, only producers and importers of biodiesel are obliged to fulfil the National Indicative Target of share of biofuels in the total usage of transportation fuels. Since the regulation is currently not applied to retail distributors they, for economic reason, rather export the biodiesel than sell it domestically. This results in low domestic consumption and increase of exports in 2016.

Production of other liquid biofuels increased in 2015 because new companies started to report their biofuels production to the Polish administration.

Transformation

In 2017, heat production from autoproducer CHP and heat plants burning municipal wastes increased due to two new plants.
Before 2000, industrial waste was used interchangeably with light fuel oil in some plants, which might result in breaks in the time series.

Consumption
The decrease in the consumption of biodiesel in the road sector in 2017 is related to an unfavourable pricing scheme on the domestic market, causing consumers to choose diesel and producers to export or blend the biodiesel they produced.

The consumption of solid biofuels in non-metallic minerals decreased in 2017 because modern clinker ovens have been replacing solid biofuels with municipal wastes.

Increases in consumption of biodiesel in 2016 are related to a policy change in the middle of the year.

Data for biogases refer only to the gas from fermentation of biomass.

Until 1998, data for industrial waste include other recovered gases which have to be reported in Coal questionnaire, causing a break between 1997 and 1998.

Between 1992 and 1993, due to data availability, there is a large increase in solid biofuels for residential, commercial/public services and agriculture/forestry.

Electricity and heat

General notes
Prior to 2010, heat supply and consumption can include autoproducers unsold heat. Previous attempts to address such issue may have caused breaks for heat production and fuel in autoproducer heat plants (1993) and in autoproducer CHP plants, and for heat consumption in industry sub-sectors.

Supply
Electricity and heat from chemical heat and other sources are available from 2011. Prior to that, these amounts could be included under different categories.

Heat distribution losses are available from 2004. Prior to that they are included in consumption.

Heat production from heat pumps is available from 2009.
Transformation

For 2019, the increase in electricity output from industrial waste was in part due to the opening of a new waste-to-energy plant in late 2018.

In 2019, electricity output from solid biofuels increased following the introduction of a new state support scheme. In 2016, output declined following a reduction in state support for biomass co-firing.

For the 2017 edition, the Polish administration revised electricity production data from power plants run by combustible fuels, reclassifying those that were previously reported as main activity CHP as main activity electricity plants. These revisions mainly affected coal-fired power plants and created breaks in time series from 2004 onwards.

In the 2017 edition, the Polish administration reclassified some amounts of electricity consumption from chemical and petrochemical sector to oil refineries, following access to improved survey methods.

Due to a reclassification of plant types, there is a break in time series in 2015 for the generation of heat in autoproducer CHP plants in the iron and steel sector.

In 2014 and 2008, a number of CHP plants were reclassified from autoproducer to main activity producer due to an industry re-organisation.

Prior to 2013, electricity used for pumped storage (mixed plants) is included under used for pumped storage (pure hydro pumping plants).

Data for direct use of geothermal heat are available from 2000 and direct use of solar thermal heat in commercial/public services from 2002 and in residential from 2009.

Heat consumption in energy industry own use includes process heat not sold before 1995.

Data for electricity production in autoproducer electricity plants are available from 1986.

Consumption

Electricity consumption in Road refers to consumption in designated public charging spots. Charging of vehicles in a residential setting is included in Residential consumption.
Portugal

Source
Direção-Geral de Energia e Geologia, Lisbon.

Coal

General notes
Hard coal data prior to 1978 may include sub-bituminous coal.

Transformation
In 2022, the production of electricity from coal stopped as the last coal-fired power station closed in November 2021.

Consumption
In the 2024 edition, the General Directorate of Energy and Geology reallocated industry consumption of anthracite, for 2014 and 2015, and coke oven coke, from 2014 onwards, from chemical and petrochemical and non-metallic minerals to iron and steel to better align with the National Energy Balances and the National Accounts Statistics.

Between 1997 and 2001 gas works gas was gradually replaced by natural gas in the commercial/public service and residential sectors.

The production of pig iron ceased in the first quarter of 2001, leading to decreases in supply and consumption of coking coal, coke oven coke, coke oven gas and blast furnace gas in 2001.

Oil

General notes
The increase in refinery throughput in 2015 is a result of increased refinery capacity linked to the expansion of the Sines refinery.

A new hydrocracking unit started operations in Sines Refinery in April 2013. This explains the 2013 increase in refinery feedstock imports, as well as middle distillate production.
Supply

Production from other sources (natural gas) of other hydrocarbons corresponds to hydrogen used in refineries, also represented as the output of non-specified transformation in the balances format.

Scheduled refinery maintenance lasting two months in 2018 affected the production and exports of secondary oil products.

Consumption

Due to an investment to increase capacity, petrochemical plant operations were stopped for almost five months, thereby decreasing the consumption of naphtha and LPG for non-energy use in 2018.

Consumption of gas/diesel oil in industry and commercial/public services represents diesel use in mobile fleets.

Natural gas

Supply

In February 1997, Portugal started to import natural gas.

The surge in 2017 imports is attributed to the consumption of gas-fired power plants that filled in the gap of decreased hydro-generation due to a drought.

Transformation

Since 2012, data reported for non-specified transformation represent natural gas used for hydrogen manufacture. Prior to this year, these quantities are reported under oil refineries.

The 2002 decrease in natural gas used for gas works (transformation) is due to the closing of the Lisbon gas works plant in May 2001.

Biofuels and waste

General notes

Data for solid biofuels were revised in a previous publication by the National administration from 1990 to 2001, which may result in breaks in time series between 1989 and 1990.
Data are available from 1994 for **biogases**, from 1999 for **municipal waste** and from 2003 for **industrial waste**.

**Consumption**

The use of **biogasoline** for blending decreased in 2017 because it is no longer compulsory to use biofuels in gasoline.

Data for **solid biofuels** were further revised based on a new survey on industry, resulting in breaks in sub-sectoral consumption for 2012.

Between 2009 and 2010 a new survey on energy consumption in households creates a break in time series in the **solid biofuels** consumption in residential time series.

**Electricity and heat**

**Supply**

Data for production of electricity from **solar photovoltaic** and **wind** are available from 1989.

The large decrease in electricity output from hydro for 2017 is due to decreased rainfall.

**Transformation**

In 2019 and 2020, one of the two **other bituminous coal**-fired plants in Portugal operated with reduced output. The plant permanently closed in late 2020.

In the 2017 edition, the data for production of **electricity** by autoproducer **hydro** plants were revised between 1990 and 1999, according to a new national methodology.

For 2016 data onwards, **heat** and **electricity** production from chemical sources have been reclassified as autoproducer CHP production from **industrial waste**, causing cessation of the heat and electricity generated from heat from chemical processes time series, and causing breaks in the industrial waste time series between 2015 and 2016.

In 2007, some power plants that were previously reported as main activity CHP have been reclassified as autoproducer CHP.
In 2007, the power station that burns industrial waste started to work as a CHP plant, whereas previously it was only producing electricity.

New plants fuelled by solid biofuels and by municipal waste started in 1999.

Prior to 1992, data for electricity production by autoproducers include production from combustible fuel sources only.

Electricity production from other oil products refers to methanol.

Data for production of electricity in main activity producer CHP plants and the associated fuel inputs are not available prior to 1980.

Consumption
For autoproducers, due to the legal status of most CHP Autoproducer plants, heat consumed corresponds in most cases to the sector where heat is generated.

In April 2021, an oil refinery shut down which led to a decrease in heat consumption in 2021 and 2022.

In the 2017 edition, the Portuguese administration reclassified some amounts of heat consumption from the residential to the commercial and public services sector for the period 1998 to 2014 following a new national methodology. Data for direct use of solar thermal heat is available from 1989 and direct use of geothermal heat from 1994.
Slovak Republic

Source

General notes

Data are available starting in 1971.

Coal

General notes

BKB includes peat products.

In 2019 there is a general decrease in coal supply affecting all products, which is driven by less coal-fired power generation and reduced operation in the iron & steel sector.

Data for anthracite, patent fuel and coal tar all begin in 2005. Prior to this, anthracite was included with other hard coals, and patent fuel and coal tar data were not reported.

Since 2005, data for coal tar and patent fuel are based solely on trade receipts. Production of coal tar which is consumed within the national boundary is not reported. Consumption of patent fuel adopts the residual methodology for statistical differences described above.

Breaks in time series may exist between 2000 and 2001 as the result of the implementation of a new survey system.

Commercial/public services also includes statistical differences for other bituminous coal, lignite, patent fuel and coke oven coke from 1980 onwards and BKB from 1989 onwards.

Supply

Coal mining is scheduled to end in the Slovak Republic by 2023.
**Oil**

**General notes**

Starting with 2016 data ethane is included with refinery gas.

From 2001 onwards, kerosene type jet fuel includes small amounts of other kerosene.

**Transformation**

In 2018, one of the companies changed its status from main activity producer CHP plant to autoproducer CHP plant, resulting in a decrease in refinery gas and fuel oil consumption for main activity producer CHP.

Between 2008 and 2009, one of the companies changed its status from autoproducer CHP plant to main activity producer CHP plant, resulting in a decrease in fuel oil consumption for autoproducer CHP.

**Consumption**

In 2018, one of the companies changed its status from main activity producer CHP plant to autoproducer CHP plant, resulting in an increase in fuel oil consumption in the chemical and petrochemical industry.

For gas/diesel oil, road data include rail use.

Small quantities of kerosene-type jet fuel used for domestic aviation are included in international aviation bunkers data.

Data for energy use of white spirit are not available.

**Natural gas**

**General notes**

In the 2024 edition, 2022 data were submitted with an updated methodology leading to a minor break in the time series for some flows between 2021 and 2022. In the next edition a revision is expected to eliminate these breaks. Data for losses were not available between 2009 and 2013.

**Supply**

In 2002 the gross calorific value (GCV) of production increased significantly as extraction from a field with a low GCV ended.

Imports include gas used for pipeline compressor stations.

**Transformation**

In 2014, the decrease in autoproducer CHP plants consumption was due to a plant closure.

*Autoproducer electricity* plants stopped operation in 2016.

Amounts in *non-specified transformation* represent *natural gas* used for hydrogen manufacture. This hydrogen is used for hydrodesulphurization and for hydrocracking in oil refineries.

**Consumption**

In 2018, following a change in the nature of its economic activity (as per the NACE classification), a big consuming company is now accounted for in the natural gas consumption for the mining sector, leading to a substantial increase.

In 2016, non-energy use of natural gas in the *chemical and petrochemical industry* decreased due to a two-month stoppage in ammonia production.

In 2001, there is a break in time series for energy use in *oil and gas extraction* due to the application of the IEA’s definition starting that year.

There are inconsistencies in the time series of *commerce/public services* as this sub-sector was computed as a residual.

**Biofuels and waste**

**General notes**

Prior to 2001, the data reported as *industrial waste* include *biogases* and *municipal waste*. 
Consumption

In 2024 edition, solid biofuels residential consumption data have been revised since 2010 thanks to the cooperation between the National Statistical Office and the Slovak Hydrometeorological Institute (SHI) which launched a survey on biomass consumption.

Electricity and heat

General notes

Data for solar photovoltaic are available from 2010.

Supply

For 2018, heat supply of main activity producer CHP plants declined due to the closure of a large producer in January 2018.

Electricity and heat from other sources refer to waste heat (flue gases).

Transformation

In the 2023 edition, heat supply from main activity nuclear CHP plants was reclassified to main activity nuclear heat plants for all years starting from 2001.

In the 2023 edition, electricity supply from main activity nuclear CHP plants was reclassified to main activity nuclear electricity plants for all years starting from 2001.

For 2020, no municipal waste use is reported at autoproducer electricity plants or autoproducer heat plants, as the plants reported the production under autoproducer CHP.

For 2020, the efficiency of production using other bituminous coal at main activity CHP plants is above the expected range. Conversely, for 2021, 2020 and 2019, the efficiency of heat production using biogas at main activity plants is far below the expected range. The Slovak Administration is investigating these issues. Revisions are pending.

For 2018, opposing trends in residual fuel oil use at Autoproducer and Main CHP plants are due to changes in plant classifications following a merger.
For 1990 to 2003, electricity and heat production from combustible fuels have been estimated based on the data on fuel inputs to electricity and heat plants reported in the annual fuel questionnaires.

Prior to 2001, electricity generation from primary solid biofuels, municipal waste and biogases are included with industrial waste.

**Consumption**

For 2018, the apparent decline in heat consumption in the oil refineries and chemical (incl. petrochemical) sectors is due to a merger between companies in those sectors and a CHP plant.

For 2018, the increase in electricity consumption in the mining and quarrying sector is because a larger consumer was reclassified.

The low electricity consumption in oil refineries in 2003 and 2004 is due to a change in ownership and work carried out on a refinery.

Data for direct use of geothermal heat are available from 2001 and direct use of solar thermal heat from 2005.
Slovenia

Source

Statistical Office of the Republic of Slovenia, Ljubljana.

General notes

Breaks in the time series appear for inputs to and outputs from electricity generation between 2017 and 2018 due to a change in methodology. This is most notable for lignite-fired main activity producer CHP and electricity-only plants. Data for 2018 onwards are reported on a unit basis, whereas data for previous years are reported on a plant basis.

A new energy data collection system was implemented in January 2001, causing some breaks in time series between 1999 and 2000.

Data for Slovenia are available starting in 1990. Prior to that, they are included in Former Yugoslavia.

Coal

Transformation

In the 2024 edition, lignite use in main activity producer electricity and CHP plants decreased considerably in 2022 due to the Slovenian Government intention to transition away from coal-fired power plants.

From 2018, there is a change in methodology for reporting CHP generation which reflects in new figures in only-electricity production. Revisions prior to 2018 are not expected.

In 2015, one of the main activity electricity plants burning lignite ceased its operations.

Oil

Supply

Time series for crude oil production and fuel oil for international marine bunkers end in 2021 because the corresponding activities stopped in 2022.
Between 2013 and 2014, a break in imports and exports time series for kerosene-type jet fuel and fuel oil appears due to improvements in reporting methodology. New trade corresponds to imports that are first stocked on Slovenian territory and later re-exported.

Consumption
In the 2021 edition, there is a break between 2017 and 2018 for white spirit whereby consumption is reported for various industry sub-sectors due to a change in reporting methodology by the Slovenian administration.

Time series for motor gasoline and gas/diesel consumption in road fluctuate as they are computed by the Slovenian administration as residual between the supply and the total consumption of all other categories.

Natural gas

Transformation
In 2014, improvements in a main activity producer CHP plant resulted in a substantial reduction of natural gas consumption in this sector.

Consumption
In 2011, the decrease in the chemical and petrochemical sector non-energy use consumption is due to minimal use of gas for production of methanol.

There are inconsistencies in the time series for commercial/public services as this sub-sector is computed by the Slovenian administration as a residual.

Biofuels and waste

Supply
In the 2024 edition and only for 2022 data, more disaggregated information on Solar PV autoproducer electricity plants were obtained by the Slovenian Statistical Office. This results in a break in the time series of electricity generation and capacity of the different types of Solar PV plants by capacity between 2021 and 2022.

Solar PV autoproducer electricity production in Slovenia contains from 2019 onwards the share of self-consumption from Residential and Commercial and public services. This has not been the case between 2015 and 2018.
Consumption

As a result of a new survey on energy consumption in the services sector, in the 2024 edition the Slovenian administration reported for the first time consumption of solid biofuels in “Commercial and public services” for 2022.

Increases in consumption of biodiesel starting from 2017 are the result of an amended energy policy, which went into effect in mid-2017.

The break in time series between 2008 and 2009 for solid biofuels is due to revisions based on a new household survey which is to be carried out on an annual basis.

Breaks in total final consumption for industrial waste prior to 2008 are a result of a sectoral reclassification.

Electricity and heat

Supply

Solar PV autoproducer electricity production in Slovenia contains from 2019 onwards the share of self-consumption from Residential and Commercial and public services. This has not been the case between 2015 and 2018.

Transformation

In 2018, Slovenia began gradually changing the sources of data for main heat plants from questionnaires to administrative sources. This change has resulted in some variation in reported efficiencies, in particular, for natural gas.

Consumption

Electricity consumption before 2022 that could not be allocated to a specific sector was reported under commercial and public services. New surveys were able to allocate parts of the electricity consumption to additional sectors. Starting from 2022, all electricity consumption that could not be allocated is reported under not elsewhere specified other).

Breaks occur between 2017 and 2018 for electricity consumption data (in particular, for Machinery and Construction) due to a change in the sample frames and sample sizes used in surveys.

Data on electricity consumption in Road are available from 2017.
In 2017, the apparent increase in electricity consumption in Rail is due to improved data provided by a new survey launched by the Ministry of Infrastructure in 2018.

Direct use of solar thermal and geothermal heat is available from 2009.

Surveys for data on heat consumption are available from 2003 onwards for the residential, industry and energy sectors. Prior to 2003, the data have been estimated by the Slovenian administration.
Spain

Source

Ministerio para la Transición Ecológica y el Reto Demográfico, Madrid.

General notes

Spain is currently working on improving its data collection system. Therefore breaks in time series are present in the data and historical revisions are expected in future editions.

Coal

General notes

The calorific values for sub-bituminous coal are correct on an as received basis, and comply with definitions of sub-bituminous coal on a moist, but ash free basis.

Supply

Since 2019, capacity of coke oven coke production has decreased in Spain. As a consequence, the imports of coke oven coke have increased and the imports of coking coal have decreased.

Hard coal mining ceased in Spain at the end of 2018. Consequently, the production figures for other bituminous coal, sub-bituminous coal and anthracite are zero from 2019.

Import and exports figures include transit trade. This affects specially anthracite. There is ongoing work to improve this situation.

The main coke oven coke producer closed in 2019, which meant a significant reduction of the quantities of coke oven coke produced. This also affected the coking coal imports.

Lignite mining ceased in 2008.

Underground production of sub-bituminous coal ceased in 2016.
Transformation

Half of the coal power plants closed in Spain in June 2020. Due to this great reduction of the coal plants in Spain, figures in transformation have decreased greatly, especially in Main Activity Producer and other bituminous coal.

The main Main Activity Producer plant consuming coke oven gas has had several stops within 2020, which have affected the consumption and the efficiency figures.

In 2018 edition, a reclassification of plants from autoproducer to main activity has led to breaks between 2015 and 2016.

Consumption

Iron & steel production slowed down in 2019. As a result, energy consumption has decreased this year in electricity, natural gas and all coal products related to this sector (coking coal, coke oven coke, coke oven gas, blast furnace gas).

In 2021 edition, blast furnace (energy) consumption has been revised back to 2003.

Oil

General notes

A change in the reporting system occurred mid-1996 resulting in some breaks in time series.

Transformation

In 2022, there is a break in the historical series for LPG due to a switch from natural gas to LPG made by one of the reporting CHP units.

Consumption

The Spanish administration provides from 2022 a more detailed breakdown in some sectors such as non-bio gasoline consumption for domestic navigation.

A more detailed breakdown in some consumptions such as LPG, non-bio gasoline, non-bio jet kerosene and non-bio gas/diesel oil used for refinery fuel appears in 2021 due to the inclusion of decimal points in the reporting.

Gas/diesel oil is no longer used in coal mines due to the cessation of coal mining production in 2020.

A more detailed breakdown in some consumptions time series appears between 2012 and 2013 due to an update and improvement in the reporting methodology.
Natural gas

General notes
Spain has implemented a new tool in data collection, so there are currently breaks in the time series for 2014 and 2015 in transformation and industry respectively.

Supply
Starting in 2020, Spain was able to obtain information about international marine bunkers, which led to a re-allocation of export flows initially included in Non-elsewhere Specified for the period of 2015 to 2019.

Transformation
The increase in the transformation sector consumption for 2017 comes from more gas-fired plants being used to compensate decreased hydro generation due to a drought.

Due to the implementation of an updated tool for gathering information on electricity generation plants in 2013 many autoproducer electricity plants were reclassified as autoproducer CHP plants.

In 1997, the increase in input to main activity producer electricity is due to two main activity producer electricity producers running on natural gas.

Between 1993 and 1994 there is a break in time series in autoproducer CHP plants consumption, since a new survey revealed a large number of CHP autoproducers that were previously included in industry consumption.

Since 1990 the decrease of natural gas inputs into gas works gas production is due to the substitution of natural gas by manufactured gas.

Consumption
Between 2021 and 2022 there is a break in the time series for transmission/distribution losses and pipeline transport in which some data was reassigned from the former to the latter.

Between 2021 and 2022, there is a break in the time series for chemical and petrochemical in which an increase in information lead to a decrease in energy use and an increase in non-energy use.
Since 2021, data reported in liquefaction / regasification plants represent LNG that is used for cooldown of international ships.

Since 2001, the final consumption breakdown is estimated by the Spanish administration.

Between 2005 and 2006 there are some breaks in time series for the energy industry own use and for final consumption due to a change in the estimation methodology.

Since 1988 the increase of natural gas used as feedstock is due to a substitution of naphtha for the production of fertilisers.

Prior to 1982 natural gas consumption in textiles and leather, transportation equipment and machinery has been included in non-specified industry.

Biofuels and waste

General notes

Prior to 2018 data, other liquid biofuels data were included with solid biofuels. A revision of the historical time series is expected in the future.

Transformation

In 2021 consumption of solid biofuels in MAP electricity increased due to a new plant becoming operative.

In the 2022 edition, thanks to a split of paper industrial waste between renewable and non-renewable, some units reports industrial waste in electricity autoproducers. For this reason, in 2020 the electricity generation increased greatly. In addition, in 2020 a CHP plant reported generation from hydrogen produced through membrane systems using salt water reservoirs. This product has been allocated to industrial waste since non-renewable electricity is used. For 2023 edition, it has been reported as “other sources”.

Heat production from renewable sources is mostly not sold to third parties but rather, used for industrial purposes or consumed by heat production facilities.

2017 is the first year that data are available for the blending of biogas with natural gas. An update to the time series is expected in the future.

Based on studies from the Institute of Cork, Wood and Charcoal (IPROCOR), the efficiency of charcoal production plants is assumed to be 20%.
From 2013 data, a revision of the industry sector of some companies causes breaks in time series for solid biofuels, municipal waste and biogases.

**Consumption**

Increased consumption of biofuels from 2016 to 2017 is a result of increased demand for motor gasoline/diesel.

Prior to 2006, inputs of biogases used to generate process heat were erroneously included as inputs to transformation when they should have been reported in the appropriate industry in final consumption.

The breakdown of solid biofuels direct use in the industry sector prior to 1999 is not available.

**Electricity and heat**

**Supply**

As a result of the National Energy and Climate Plan wind and PV power and generation have increased significantly every year since 2018. Moreover, in the last years, electricity production from autoproducer solar increased due to implementation of a new regulation incentivising prosumption.

Electricity reported under other sources is from waste heat and hydrogen.

Transmission and distribution losses are estimated by the Spanish administration.

Data for electricity from solar thermal plants are available from 2007.

Starting in 2006, a new method was used to estimate the losses from final consumption, resulting in a break in time series between 2005 and 2006.

From 2005, residential rooftop solar photovoltaic electricity production data, previously reported under autoproducer, are included in main activity electricity plants according to the Spanish administration classification.

Electricity production from wind and solar are reported from 1989 when data became available.

**Transformation**

Heat production from renewable sources is mostly not sold to third parties but rather, used for industrial purposes or consumed by heat production facilities.
Revisions are expected in the 2021 edition which include some heat production from renewable sources.

In the 2020 edition, electricity generation for wind was revised from 1998 – 2017. From 2017 onwards, more accurate data on inputs and outputs for pumped hydro are available. This improvement in data quality leads to an apparent increase in efficiency.

Prior to 2018, some industrial waste and other liquid biofuels used for electricity and heat generation was reported under solid biofuels.

In the 2017 edition, a change in reporting methodology resulting in reclassification of plants from autoproducer electricity to autoproducer CHP has led to breaks in electricity production in autoproducer electricity plants between 2012 and 2013 and 2014 and 2015. The administration anticipates further revisions to the time series in subsequent cycles.

The National Energy Commission reclassified plants that consume biogases, leading to breaks in time series between 2007 and 2008.

In 2000 and 2006, many plants were reclassified from main activity producer to autoproducer or vice versa.

For 2004 and 2005, electricity production from gas/diesel oil is included with fuel oil.

The large increase in electricity output from main activity producer electricity plants fuelled by natural gas in 1997 is due to the opening of a new plant.

Prior to 1989 inputs and outputs from the use of biofuels and waste to generate electricity and/or heat (i.e. comprising solid and liquid biofuels, industrial waste, municipal waste and biogases) are reported under non-specified biofuels and waste.

Prior to 1987 electricity production in main activity producer CHP plants is included with production from main activity producer electricity plants.

From 1983, net electricity production by autoproducers has been estimated by the Spanish administration, and includes production from combustible fuel sources only and net electricity production by autoproducer CHP plants is included in electricity plants.
Consumption

For 2022, the consumption on non-ferrous metals fell to almost half, due to the contraction of the aluminium sector (the main company closed).

For 2021 data, all the sectors had their consumptions increased after COVID-19 pandemics which reduced the economic activities in 2020. Residential sector is the main exception since it did not change much compared to 2020. Iron & Steel, non-metallic minerals, food, beverages and tobacco, paper, pulp and printing and construction showed the highest increases with respect to 2019 data. Consumption on non-ferrous metals was affected by the contraction of the aluminium sector. In the transport sector, road continued to increase due to the growth in the number of electric vehicles.

For 2019 data, some electricity consumption was reallocated from industry non-specified to other sectors. As a result, apparent increases are observed for sectors such as textiles and leather and wood and wood products.

Electricity consumption by electric road transport vehicles includes battery and electric plug-ins, and is modelled based on vehicle registrations.

For 2012, the electricity consumption data are estimated by the Spanish administration.

Data for direct use of geothermal and solar thermal heat are available from 1990.

Electricity consumption under the non-specified industry category includes the consumption for the manufacture of rubber and plastic products, furniture, repair and installation of machinery and equipment (except repair and maintenance of ships and boats) and other manufacturing. This aligns with the Classification of the Economic Activities in the European Community (NACE) group code 22 and 31 to 33 (excluding class 33.15).
Sweden

Sources

Statistics Sweden, Örebro.

Swedish Energy Agency (Energimyndigheten), Eskilstuna.

Coal

General notes

Peat products data may be reported under the category of peat, particularly for imports.

In the 2024 edition, blast furnace gas production for 2020 and losses and iron and steel industry consumption for 2020 and 2021 were revised due to new available information.

In the 2021 edition, there was a revision of the products included under gas works gas. As a result, the figures for the years 2011 to 2018 were put to zero. Previously this product included some mixture of LNG with air to form a product with lower calorific value.

Autoproducer inputs to waste heat production that is sold are reported in the respective final consumption sectors and not in transformation.

Supply

Other bituminous coal production until 1992 is coal recovered during the quarrying of clay.

Transformation

The figures in the Transformation section for the products coke oven gas and blast furnace gas were estimated until 2018; from 2019 onwards the data is obtained from surveys.

Consumption

In the 2024 edition, the Swedish administration revised the non-energy use and iron and steel industry consumption of coke oven coke for 2021 due to new available information.
Since edition 2021, the Swedish administration applied data perturbation to the consumption of other bituminous coal and coke oven coke in Industry sub-sectors, despite not affecting total Industry consumption, for the years from 2019 onwards due to confidentiality reasons.

Oil

General notes
In 2017 Statistics Sweden added more companies to their new data collection system; these have been progressively included in the reporting through 2018 reference year data.

Swedish stock data include peacetime crisis stocks. Since these stocks may be held in crude oil instead of oil products, there may be occurrences of negative stock levels for products.

Data are available from 2003 for refinery gas and from 2000 for additives and ethane.

Beginning in 2002, Sweden has changed some of the conversion factors for some products. That explains the small breaks in time series between 2001 and 2002.

Supply
In 2019, outputs of several oil products decreased as a result of refinery shutdowns lasting two months.

As reported by the Swedish administration, there is a break between 2019 and 2020 in the refinery output of other oil products which relates to the production of refinery feedstocks not included in the latter product category.

In 2018, due to a new data collection survey rolled out by Statistics Sweden which has a higher level of detail available, transfer of refinery gas, naphtha and fuel oil appear for the first time. Consequently, transfer of other products in 2018 dropped to nearly zero.

Quantities of receipts from other sources of other hydrocarbons correspond to natural gas used by refineries.

Transformation
In 2014, gas/diesel oil inputs to main activity CHP electricity plants are confidential and aggregated with fuel oil.
In 2013 data, the drop in crude oil refinery intake is related with maintenance in August and September 2013 at the Swedish refineries.

From 2011, the country’s gas works plants stopped using naphtha.

Consumption

In the 2023 edition, consumption of petroleum coke in 2021 are all reported in non-specified (industry) as the Swedish government did not have the sectoral breakdown at the time of reporting.

In 2020, the Swedish administration confirmed that all refinery gas is consumed as refinery fuel. This change in reporting methodology possibly extends to 2018 and revisions are expected.

Starting from 1995 data, Sweden has changed its standard classification of industry sub-sectors

Between 1985 and 1986, there are breaks in consumption time series of fuel oil due to more detailed reporting.

In 1984 data, consumption of other kerosene in the road sector is discontinued due to product re-classification.

Natural gas

Supply

From Other Sources – Renewables estimated in 2022 edition using data from the renewables questionnaire.

Natural gas consumption in international marine bunkers are available for the first time for the year 2017.

Transformation

In the 2021 edition, there was a revision of the products included under gas works gas. As a result, the figures for the years 2011 to 2018 were put to zero. Previously this product included some mixture of LNG with air to form a lower calorie product.

Autoproducer inputs to waste-heat production that are sold are reported in the respective end-use sectors and not in the transformation sector.
Consumption

For 2013, data for the energy use of gas by oil refineries have been estimated by the IEA Secretariat.

For 2008, data for total final consumption and its breakdown have been estimated by the IEA Secretariat based on other Statistics Sweden publications.

For years prior to 1993, road transport is included in commercial/public services.

Biofuels and waste

General notes

In the 2024 edition, the AC capacity of solar photovoltaics subgroups (PV<30 kW, PV 30-1000 kW and PV1+MW) is smaller than the total solar photovoltaics AC capacity reported, for the years from 2017 to 2021.

In the 2022 edition, the administration adopted a new data source for energy consumption in industry. This has caused breaks in the time series and the presence of new flows in 2020 in particular for solid biofuels, other liquid biofuels and biogases.

There are some breaks in time series between 2015 and 2016 in pumped hydro, industrial waste and other liquid biofuels figures due to the lack of data. The figures are expected to be modified in the 2018 edition.

From 1990 to 2006, municipal waste was reported as 60% non-renewable and 40% renewable. In 2007, reanalysis of the waste revealed the content was 40% non-renewable and 60% renewable. This was re-analysed again starting from 2016 data, when the result of the analysis revealed the split should be 52% renewable and 48% non-renewable. This results in breaks in the time series between 2006 and 2007 and also 2015 and 2016 for both renewable and non-renewable municipal waste.

In the 2018 edition, data for biodiesels were revised from 2006 to 2015 while biogasoline and bioethanol were revised from 2005 to 2015. The revisions affected indigenous production due to increased information about net trade, as well as the transformation sector, for blending with motor gasoline/diesel/kerosene and consumption in the road sector.
Supply

In the 2022 edition, for industrial waste data the administration adopted the figures from the survey "Quarterly Fuel Statistic" while in the past the "Energy use in manufacturing industry" was used. This led to a break in the time series between 2019 and 2020.

Due to a change of tax regulations in 2017, it was no longer profitable to produce fatty acid methyl ester (FAME) in the same capacity as before, so there was a drop in biodiesel production. This drop in production was substituted by imports to meet increased demand.

In the 2018 edition, trade data were added for primary solid biofuels starting from 2012. As the net trade used to be reported together with indigenous production, this has resulted in a downward revision of indigenous production for 2012-2015.

Transformation

In the 2022 edition, electricity generation from industrial waste is reported but no capacity installed is shown. This is because industrial waste is a secondary product used in other non-specified plants.

Consumption

Starting in the 2023 edition, variable industry flows, depending on the product, for industrial waste, municipal waste (renewable and non-), primary solid biofuels, biogases, biodiesel and other liquid biofuels are confidential. However, their total value is reported in not elsewhere specified industry, thus the reported total final consumption is correct.

In the 2022 edition, industrial waste consumption in the industry sector non-specified flow appears for the first time. Disaggregated data will be available in future editions.

In the 2021 edition, there are revisions in the consumption of solid biofuels in the agriculture/forestry sector starting in 2005 resulting in a break in series between 2004 and 2005. These revisions remove double counting with the residential sector.

Increased consumption of biogases in the industry sector in 2018 was because several industries switched from natural gas to biogases.
Changes in tax regulations as of 1 July, 2018 has contributed to decreased consumption of biodiesel in 2018 data.

Due to confidentiality issues, solid biofuels consumption in food, beverages and tobacco is reported with paper, pulp and printing for 2014 data.

Consumption data by sector for biogases are available from 2011.

In 2011 data, there was a change in the reporting methodology for consumption of solid biofuels and waste in the residential sector, which is responsible for breaks in time series between 2010 and 2011.

For biogases, the residential sector is used as a residual.

**Electricity and heat**

**Supply**

For 2020, the cessation of electricity output from autoproducer hydro was due to the plant no longer being classified in that category.

In the 2021 edition, upward revisions were applied to heat production and consumption back to 1997, to incorporate new data on recovered flue gas heat. Production is reported under heat from other sources.

For 2017 onwards, electricity inputs to and outputs from pumped hydro storage plants are based on a revised methodology. As a result, breaks occur between 2016 and 2017. Prior to 2017, electricity inputs to mixed hydro storage plants are reported under pure pumped plants.

Inputs to heat pumps include heat recovered from industry and from ambient sources (including sewage and seawater).

Ambient heat is shown as the indigenous production of heat.

Information on heat for sale produced in heat pumps and electric boilers is available starting in 1992.

Data on gross electricity production are sourced from an annual survey, while net production is sourced from monthly surveys. As a result, implied own use may vary.
Transformation

For 2020, the decrease in electricity output from other bituminous coal was due to a plant closure.

For 2020 onwards, the decrease in electricity output from nuclear is due to the closure of two reactors, one in late 2019, and another in late 2020.

In Sweden, heat produced in heat pumps is sold to third parties (as district heat) and is therefore included in transformation.

Heat production from solid biofuels in autoproducer CHP includes waste heat and chemical heat.

For 2012 and 2013, small quantities of bio-methanol used to produce electricity are included in other liquid biofuels, under production, as well as input and output of autoproducer CHP.

For 1997 and 1998, heat production from liquid fuels in main activity producer CHP plants includes heat recovered from flue-gas condensing.

Prior to 1992, data on electricity production from biogases are included with solid biofuels.

Heat produced for sale by autoproducer CHP plants is reported starting in 1992.

From 1987, the breakdown of net electricity production by industry for autoproducer electricity plants is available.

Prior to 1987 net electricity production by autoproducer plants includes data for CHP plants only.

Prior to 1980, heat produced in main activity producer heat plants is not available.

Prior to 1974, heat produced in main activity producer CHP plants is not available.

Consumption

Prior to 2022, electricity consumption in Road includes all energy consumption by hybrid vehicles. The Swedish Administration revised historic data in the 2024 edition.

Disaggregated data for industrial heat demand became available from 2020, due to a change of underlying data source. This lead to an increase in reported demand compared with previous years. The Swedish Administration hopes to revise the historical timeseries in a future cycle.
Consumption of electricity for distribution of district heat is included with other energy industry own use.

In 2014, consumption of electricity in the mining and quarrying and the paper, pulp and printing sectors are confidential and were incorporated under the non-specified industry sector.

Data on direct use of solar thermal are available from 1989.

Consumption of heat in industry and other sectors is available from 1984.
Switzerland

Sources

Swiss Federal Office of Energy (SFOE), Ittigen.

Carbura - Swiss Organisation for the Compulsory Stockpiling of Oil Products, Zurich.

General notes

From 1999, data on consumption result from a new survey and are not comparable with data for previous years.

Coal

General notes

Calorific values for anthracite, other bituminous coal and coke oven coke are taken from a common default figure. Calorific values for lignite are also default, but are based on dried lignite fines which have a higher calorific value.

Consumption

From 1985, industrial consumption of gas works gas is reported in non-specified industry to prevent the disclosure of commercially confidential data.

The allocation of consumption between certain coal types is estimated by the Swiss administration.

Natural gas

General notes

Since the 2019 edition, the non-specified other flow is calculated as residual flow for natural gas. Prior to this, the statistical differences used to be absorbed by agriculture/forestry.

Transformation

Since 2013 there are fluctuations in gas consumption of main activity producers CHP plants due to the fuel flexibility of a plant.
In 1996, the increase of gas input to main activity CHP plants is due to more complete accounting for all producing entities.

**Consumption**

Between 1977 and 1978, there are breaks in time series due to the introduction of a new survey by industry type.

**Oil**

**General notes**

The statistical differences for gas/diesel oil are partly due to changes in consumer stocks.

In 2004, petroleum coke production started due to the installation of a cracking unit in a refinery.

As of 1993, the Swiss administration has reported figures for naphtha that are net of quantities used for blending into motor gasoline. For 1994, 1995, 1997, 1999, 2001 and 2002 this reporting has led to negative production numbers for naphtha. For these years, the IEA Secretariat has moved the data into transfers and reduced the production of motor gasoline by corresponding amounts.

**Supply**

There is a break in stocks between 2017 and 2018 for refinery feedstocks as more detailed information of refinery activity is collected by the national administration.

In 2015, low refinery throughput is due to maintenance in May and June and to an unplanned outage in October due to a leak in a heat exchanger at the Cressier refinery. The closure of the Collombey refinery from March 2015 also contributed. As a result, imports of many oil products increased in 2015.

The Collombey refinery remained closed in 2016, resulting in decreased refinery throughput and increased imports in this year. Refinery output of petroleum coke stopped as this product was only produced at the Collombey refinery.

Data for refinery losses at the remaining Cressier refinery are low and are under investigation.

Since 2013 oil importers are obliged to compensate parts of the CO₂ emission that are produced by the transport fuels they sell. The biofuel components are exempt
from this obligation, which together with tax exemptions on biofuels, partly explains the increase in biofuel blending since.

Transformation
Gas/diesel oil non-specified transformation represents inputs to mobile and stationary power generators, of which the electricity output is unknown at this stage.

In 2012, low refinery intake is due to the temporary shutdown of the refinery in Cressier in the first semester of 2012 and maintenance at Collombey refinery.

In 1988, the reduction in refinery intake of refinery feedstocks in 1988 is partly due to a switch to crude oil and partly to a shutdown for maintenance of a refinery.

Consumption
In 2022, increase of other oil products consumption includes benzene, technical gasoline and mineral tar.

In the 2022 edition, the Swiss administration revised data from 2012 onwards for road diesel consumption in rail and domestic navigation and motor gasoline consumption in domestic navigation.

In the 2019 edition the Swiss administration revised data back to 1990 for road diesel consumption in rail and domestic navigation, and motor gasoline consumption in domestic navigation.

In 1994, the increase in consumption of gas/diesel oil is due to consumer stock-building prior to the introduction of a value-added excise tax on heating fuels as of 1 January 1995.

Biofuels and waste
Supply
Due to favourable taxation in Switzerland, the imports of biodiesel and bioethanol intended to be blended with oil products increased significantly from 2016 to 2017.

Due to a new program launched in September 2014 in which CO2 emissions due to traffic can be compensated by substituting fossil gasoline and diesel by biofuels, the imports and road consumption of biodiesels and biogasoline increased sharply starting in 2015.
Transformation

In the 2020 edition, some significant revisions were in industrial waste (non-renewable) from 2013 to 2015 for fuel input to autoproducer CHP plants because one plant operator corrected its fuel input.

Consumption

Starting in 2018, several agricultural biogas plants installed a system to measure heat production. Previously, it was estimated. Due to measurements, they realised they produce much more heat than estimated. This creates a break in series between 2017 and 2018 data.

Consumption data for biogases in the transport sector are available from 1996 to 2012 as a biogas fuel station had stopped selling biogas in 2013.

Electricity and heat

Supply

Heat production includes heat produced by nuclear power stations and distributed to other consumers.

Data for electricity production from wind are available from 1996.

Data for solar electricity production by autoproducers are available from 1990.

Transformation

In the 2023 edition, the Swiss Administration revised data back to 2013 to incorporated updated plant-level data.

For 2021, the decrease in electricity output from nuclear was mainly due to maintenance works at the Leibstadt power plant.

In the 2020 edition, some significant revisions were made to input of industrial waste (non-renewable) to autoproducer CHP plants, for 2013 to 2015, because one plant operator corrected its fuel input.

For 2019, gross heat production from heat pumps ceased following a decline in 2018. Two such facilities existed in Switzerland, the larger of which closed in 2018, followed by the smaller in 2019. For 2016 and 2017, electricity output from nuclear sources declined due to shut downs at two of Switzerland’s five nuclear power
plants (Beznau 1 and Leibstadt). For 2018, output increased due to higher availability at these two plants.

**Electricity** used for pumped storage (pure hydro pumping plants) is included under used for pumped storage (mixed plants).

In 2016, two new **pumped hydroelectric** plants went into operation.

For 2015, the large decline in **electricity** and **heat** production from **industrial waste** is due to one large main activity CHP plant significantly reduces their activity. This plant eventually closed in 2016, further lowering **electricity** and **heat** generation for this fuel.

From 2012, the **municipal waste** autoproducer plant previously reported as electricity plant met the CHP requirements and was reclassified as such.

**Biogas** is no longer being used for heat production as of 2011.

The decrease in the use of **natural gas** in main activity CHP plants in 2007 is caused by the reduced operation of one plant after the start-up of a new waste-incineration plant and the shutting down of another plant. Use increases again in 2008 due to the re-starting of a district heating plant.

The autoproducer heat plant that produced heat for sale using **municipal waste** was closed in 2006.

The breakdown of **electricity** and **heat** generation from autoproducers by sector is only partially available from 1990 to 1999, and is not available from 2000 to 2018.

Prior to 1978, data for **heat** output from CHP plants are not available.

The allocation of **electricity** production in main activity producer electricity only and CHP plants between 1967 and 1973, and in main activity producer CHP and autoproducer CHP plants in 1974 are Secretariat estimates.

All **hydro electricity** production is reported under large scale hydro (> 10 MW) due to the fact that production data are not being collected by different size capacity categories.

**Consumption**

In the 2024 edition, modelling of electromobility was revised leading to changes in the sectoral breakdown. Additionally, the sectoral breakdown within the
industry sector has been revised according to the latest information from the corresponding survey.

In the 2023 edition, the Swiss Administration revised the breakdown of industrial consumption data back to 1999 to incorporate data from the latest surveys. In addition, electricity consumption by electric vehicles previous reported under the Industry, Residential, and Commerical and public services sectors was reallocated to Road.

Consumption in the transport equipment industry is included with machinery.

Geothermal direct use is overstated as it refers to heat production by geothermal heat pumps, which include inputs from electricity and/or gas in the transformation process.

The breakdown of final consumption of electricity in the industry sector from 2000 to 2001 was estimated by the Secretariat.

Data for direct use of geothermal heat and solar thermal heat are available from 1990.

Republic of Türkiye

Sources

Ministry of Energy and Natural Resources (Enerji ve Tabii Kaynaklar Bakanlığı), Ankara.

Petrol İşleri Genel Müdürlüğü, Ankara.

Coal

General notes

In the 2024 edition, coal data for the Republic of Türkiye includes anthracite trade and final consumption in the industry sector for year 2022. This is due to newly reported data from the Turkish administration. The high statistical difference observed for this product is due to inaccurate data reporting from the industry sector, which reports part of the final consumption of anthracite as other bituminous coal instead. For years previous to 2022, anthracite is included in other bituminous coal data for all flows as disaggregation is not provided.
In the 2018 edition, revisions were conducted by the Turkish administration back to 1990 impacting the transformation and industrial sector. The revisions in the transformation sector were the result of new data submitted by the Turkish Electricity Transmission Company (TECT).

In the 2017 edition, historical revisions on coal tar data were conducted by the Turkish administration due to new available information.

Data from 2012 onwards utilised the latest census data, causing breaks in time series between 2011 and 2012.

Data from 2008 are provided from the results of an improved questionnaire. Significant changes occur in consumption patterns within the iron and steel industry, coal mining as well as across industry, residential and commercial/public services for other bituminous coal.

Calorific values for fuels used for electricity, CHP and heat plants are obtained from data submitted to the Ministry of Energy and Natural Resources (MENR) by the Turkish Electricity Transmission Company, and these values may differ significantly from production and import values provided by MENR, causing imbalances for some years.

Due to government regulations in industry and residential, in particular, there has been a shift from the use of domestically produced coal to imported coal and natural gas.

Transformation

In the middle of 2014, most autoproducer plants in the Republic of Türkiye were reclassified as main activity producer due to a change in the legislation. Amongst other things, this brought the reporting of unsold heat and prorated inputs in line with IEA methodology.

Consumption

In the 2023 and 2024 editions, other bituminous coal and lignite consumption in residential and commercial and public services for 2021 and 2022 were estimated by the IEA Secretariat.

In the 2018 edition, revisions on industrial coal consumption were conducted by the Turkish administration back to 2010 due to new available information.
Privatisation of state-owned coke ovens in recent years results in incomplete information on **coke oven gas** distribution.

In the 2017 edition, consumption of **sub-bituminous coal** in construction has been reclassified by the Turkish administration as consumption in the non-metallic minerals industry.

In 2015, a new survey was introduced by the Turkish administration to collect more detailed industrial consumption data, resulting in breaks in time series between 2014 and 2015.

---

**Oil**

**General notes**

A project to upgrade the İzmit refinery was completed in 2015. This resulted in considerably higher refinery throughout in 2015, compared to previous years. The project included a new unit to convert high sulphur fuel oil into higher grade products, such as gas/diesel oil and motor gasoline, and producing petroleum coke as a by-product.

In the 2016 edition, the Ministry of Energy revised time series for **kerosene-type jet fuel** from 2013. Sales to foreign airlines, previously accounted for under exports, are now reported under international aviation according to the IEA methodology. Data could not be revised for prior years. Exports of **jet kerosene** up to 2012 years may include international aviation consumption.

In the 2016 edition, the Ministry of Energy revised crude oil net calorific values from 2010 due to a new methodology for calculating them.

Production from other sources (natural gas) of **other hydrocarbons** corresponds to hydrogen used in refineries, also represented as the output of **non-specified transformation** in the balances format.

From 2013, marine fuels are reported under **fuel oil** instead of **gas/diesel oil**.

From 2012, **petroleum coke** data are reported.

**Supply**

In 2019, the increase in refinery throughput is due to the start-up of the new STAR refinery.
In 2018 Izmir refinery underwent maintenance for several months impacting the overall throughput quantities.

In 2014, the drop in lubricants imports and consumption is related to a legislation change effective 1st of January 2014 regarding base oil imports.

From 2012, new information on additives imports (MTBE) data became available.

From 2012, no exports breakdown is available for white spirit, lubricants, bitumen and other products.

From 2010 data, more accurate NCVs for crude oil are available due to the implementation of a new survey.

**Transformation**

In 2021, there is an increase in inputs of naphtha for transformation in the petrochemical industry as processed in the STAR refinery.

**Gas/diesel oil** and **fuel oil** consumed to produce electricity are used in both oil and coal-fired plants.

**Consumption**

Consumption of **white spirit and SBP** decreased in 2022 due to new environmental regulations.

Consumption of **biodiesel** for road transport increased in 2018 due to legislation coming into effect on 1 January 2018, which enforced a 0.5% blending obligation for gas/diesel oil.

In the 2019 edition consumption of **petroleum coke** was reclassified from non-energy to energy use.

For the 2015 data, new surveys were used to create a more detailed breakdown of the industry and other sectors. This led to breaks in time series between 2014 and 2015.

From 2014, information on gas/diesel consumption in fishing is available.

From 2013, additional information on **petroleum coke** cement consumption is available.
Prior to 2012, consumption of other oil products in the chemical sector was included under non-specified industry.

Between 2010 and 2011, breaks in consumption time series for LPG, motor gasoline and gas/diesel oil appear due to improved survey methods.

Between 1977 and 1978, the end-use classification of gas/diesel oil and fuel oil were changed in the Turkish national statistics resulting in breaks in time series.

Natural gas

Supply

LNG Exports to Switzerland is natural gas that is sold to a Swiss-based company by loading it on a cargo ship, the destination of consumption is unknown.

LNG Exports to Serbia are exported by road tanker.

Exports reported by the Turkish administration represent transit gas.

In 2008, there is a break in time series for stock changes due to a revision of storage capacity data.

In December 2016, the first Floating Storage and Regasification Unit (FSRU) terminal started to work, allowing thus greater import quantities and stock levels.

Transformation

Non-specified transformation of natural gas represents amounts used to produce hydrogen for hydrocracking in refineries.

In the 2018 edition, Turkish administration revised 2014 and 2015 data, as some main activity producing plants in the Republic of Türkiye were reclassified as autoproducers.

Consumption

In 2015, a new survey was introduced by the Turkish administration to collect industrial consumption data, resulting in a substantial decrease of consumption reported under non-specified industry.

In 2013, energy use of natural gas in blast furnaces was zero, as gas was replaced by coal and coke.
From 2009, there are some breaks in time series across all sectors, as consumption data started being collected by a different institution, the Turkish Energy Market Regulatory Authority.

In 2006, there is a break in time series for non-energy use in chemical and petrochemical industry due to improvements in the classification.

Prior to 2000, data for commercial/public services were included in the residential sector.

Between 1999 and 2001, the decrease in natural gas chemical and petrochemical feedstocks is linked to the activity of the fertiliser industry.

Since 1988, data for natural gas consumption in the chemical and petrochemical industry (for fertilisers) and in non-specified industry (dye industry) are available.

Non-specified industry includes the natural gas distributed by OIZ (Organised Industrial Zones).

### Biofuels and waste

#### General notes

The Turkish administration only intermittently surveys renewables and waste used for power and heat. Due to this fact, some breaks may appear in the biofuels and waste time series.

#### Transformation

Biodiesel blending with diesel increased in 2018 because there was a new policy requiring that diesel be blended with 5% biodiesel.

In 2017, the increase in electricity production in main activity producers burning solid biofuels is related to new plants.

#### Consumption

In the 2024 edition, data for solar thermal consumption in the industrial sector were surveyed for the year 2022, deviating from the previous method of estimation up to 2021. This adjustment may lead to data discontinuities between 2021 and 2022. Time series revisions are expected in future publications.
Starting with 2018 data, new sub-sector data in the industry sector for industrial waste (non-renewable) and solid biofuels is available as a result of a new survey. Backward revisions will not be available in the future.

Prior to 1998, consumption in the wood and wood products sector includes that of the paper, pulp and printing industry.

**Electricity and heat**

**Supply**

Other sources heat production represents recovered waste heat (steam) from industry, mainly from cement and glass manufacturing, while other sources electricity is the proportion of generation by plant obtained from this heat.

Electricity production from wind is available starting in 1998.

**Transformation**

In 2021, the decrease in electricity generation from autoproducer hydro plants was the result of a power plant being reclassified as a main activity producer.

In 2020, the decline in electricity production from lignite was due to temporary plant closures for environmental refits.

In 2017, the increase in electricity production from solar PV main activity producers is related to new plants coming online, mostly unlicensed.

In the 2006 edition, the Turkish Statistical Office started providing electricity and heat output on the basis of a new survey that revised time series back to 2000. This causes breaks in the time series between 1999 and 2000. Not all of the input time series have been revised.

A new gas-fired main activity producer CHP plant was put into operation in 1999 and a new autoproducer electricity plant fuelled with coking coal started in 2000.

Data for blast furnace gas for electricity and heat generation are available from 1995.

Data on electricity generated from biofuels are available from 1991.

In 1995, the Turkish administration reclassified autoproducer plants by type and source to be consistent with IEA definitions. This causes breaks between 1994 and 1995 for electricity production, most notably in plants fuelled by biogases.
Consumption

Prior to 2014, consumption data in the machinery sector includes transport equipment.

Comprehensive data on electricity consumption are available from 1973. This causes a break in the time series between 1972 and 1973.
United Kingdom

Source

Coal

General notes
In the 2024 edition, the UK administration revised and reallocated several flows in supply, transformation and final consumption, since 2019 for other bituminous coal, coke oven gas and blast furnace gas, or only for 2021 for patent fuels and coke oven coke, due to new available information.

In the 2023 edition, the UK administration revised stock change of other bituminous coal for 2020 due to new available information.

In the 2021 edition, BEIS revised the coal production by type (other bituminous coal and coking coal) as a result of an update of their models. The revisions go back to 2016 and reallocate some production quantities from other bituminous coal to coking coal. Some adjustments were done on TFC/Industry/ Not elsewhere specified to adjust the statistical difference to the new production figures.

Oxygen steel furnace gas data are reported with blast furnace gas rather than as other recovered gases.

In the 2017 edition, calorific values of other bituminous coal were revised for the period 2002-2015 due to a change in the methodology, impacting all flows.

Prior to 1994, the consumption of substitute natural gas is included with natural gas while its production is included with gas works gas.

Supply
Underground production of coking coal increased in 2019 as Aberpergwm mine came back into operation in September 2018.

Underground production of other bituminous coal in 2016 decreased due to the closure of Hatfield, Thoresby and Kellingley mines.
Transformation
In the 2024 edition, coke oven coke and coke oven gas production for 2022 have been estimated by the IEA Secretariat.

In the 2023 edition, the consumption of coke oven gas in autoproducer electricity, CHP and heat plants and of blast furnace gas in autoproducers electricity plants for 2019 and 2020 was revised by the UK administration due to new available information. As a result, also final consumption in iron and steel industry was revised.

The consumption of solid biofuels increased in 2015, as the largest power station in the UK converted a further unit from coal to biomass midyear, and the previously converted unit had a full year of operation in 2015 rather than just the last few months of 2014.

The market decline in use of other bituminous coal from 2013 onwards for autoproducer electricity generation was due to a plant being sold to a dedicated main-activity electricity producer.

Consumption
In the 2023 edition, industry consumption of other bituminous coal in chemical and petrochemical and food, beverages and tobacco for 2019 and 2020 was revised by the UK administration due to improvements in the estimation methodology.

Consumption shown for the commercial/public services includes consumption of some of non-specified other.

Oil
General notes
The UK classifies gas diesel oil into “white diesel” (identified with road diesel in the IEA databases) and “red diesel” (identified with heating and other gasoil). White diesel is taxed at a higher rate than red diesel. Due to a change in the tax duty status of diesel oil, red diesel cannot be used for industrial or commercial purposes in the UK since April 2022. Therefore, many demand flows have switched from “heating and other gasoil” to “road diesel” in 2022.
There is a break in series between 2015 and 2016 due to a change in methodology and estimation process applied by the UK administration in the 2020 edition, which involves including data from trade body members and major suppliers.

Breaks in time series occur for LPG between 2007 and 2008 due the inclusion of additional information from the petrochemical sector.

For international marine bunkers and domestic navigation, a different bunkers methodology is applied from 2008, in line with UK’s National Atmospheric Emissions Inventory. From 2013 onwards, improved data are available for international marine bunkers. Deliveries to international marine bunkers may be underestimated in previous years.

For consumption of oil products, the UK administration revised its methodology from 2008 to better track consumption of imported oil products and domestically refined oil products sold through third parties to final consumers.

Breaks in time series appear in 2013 for ethane, naphtha, white spirit, lubricants, bitumen, petroleum coke and other oil products, as new information became available on the energy use of these products.

Supply

In the 2023 edition, the UK administration changed the methodology for capturing NGL imports and transfers to the downstream sector (into LPG) in 2021. There may be breaks between 2020 and 2021.

In the 2021 edition, the UK administration revised the stock levels (national territory) of motor gasoline and gas/diesel oil from 2015 onwards, resulting in a stock break between 2014 and 2015.

Refinery output of ethane decreased in 2019 due to the closure of the Mossmorran NGL plant.

Biodiesel blending notably increased in 2019 per the requirement of the Renewable Transport Fuel Obligation.

Indigenous production of crude oil and natural gas liquids increased in 2018 primarily due to multiple new projects coming online at the end of 2017.

Refinery output of total oil products decreased in 2018 due to relatively high levels of maintenance throughout 2018.

From 2008 data on naphtha and motor gasoline better reflects the blending of these products. Breaks in series may appear between 2007 and 2008.
Between 2007 and 2008 breaks in time series appear for **NGL** as a result of the UK administration obtaining additional information on the destination of some upstream **NGL**. Previously classified as exports, these amounts now appear as transfers, mainly to **LPG**, then as consumption in the petrochemical sector.

Between 2002 and 2004 products transferred include backflows and interproduct transfers. From 2005 onwards backflows are estimated by the UK administration.

Condensates are reported in **NGL** from 1980 and in crude oil until 1979.

**LPG** includes ethane until 1980.

**Other hydrocarbons**, reported until 1994, correspond to bitumen production from coal.

**Consumption**

In 2021, there is a decline in non-energy use of **naphtha** in the chemical (including petrochemical) sector as one of the largest petrochemical plants in the UK closed a major hydrocarbon cracker in late 2020 for maintenance but was not re-opened in 2021. Instead, it is now being converted to process ethane.

Breaks in time series may occur in the consumption of **gas/diesel oil** between 2011 and 2012, following the UK’s administration improved access to customs trade data, in particular duty figures for demand in agriculture.

**Natural gas**

**General notes**

In the 2020 edition, revisions were made to years 2017 and 2018 to align with the DUKES publications.

Since 1992, *distribution losses* include metering differences and losses due to pipeline leakage.

**Supply**

In the 2018 edition, UK administration revised the supply balance back to 2008 to update Norwegian imports from two terminals previously reported as *indigenous production*. 
In 2002, the increase in imports is due to increased supplies from the Norwegian sector of the North Sea through the Vesterled pipeline, which was commissioned in the 4th quarter of 2001.

In 2017 data the decreased closing stock level is related to the cessation of storage operations in Rough, UK’s single largest storage facility.

Transformation
The natural gas reported in coke-oven (transformation) is used to form synthetic coke oven gas rather than undergoing a coking process.

Consumption
Between 2015 and 2016 there are some breaks in the time series in the energy, industry, and other sectors due to a change in methodology.

In the 2018 edition, natural gas consumption in the sectors of industry, residential, commercial/public services, was revised back to 2008 to include information from other data sources such as the Purchases Inquiry, EU ETS and ONS Index of Services and Production.

In the 2019 edition, the UK administration proceeded to revisions back to 2015 based on improved data from the Purchases Inquiry annual survey of the Office of National Statistics (ONS).

Before 2008, the commercial sector consumption is included in non-specified other, while that of public services is shown separately.

Between 2007 and 2008 there are some breaks in time series in sectoral consumption due to a new methodology of data estimation.

Natural gas consumption includes substitute natural gas made at gas works and piped into the natural gas distribution system.

Non-specified industry represent to sales by independent gas suppliers unallocated by category.

Consumption by the mining and quarrying and the wood and wood products sectors is included in non-specified industry.

Non-specified energy includes gas used for heating and pumping operations in the distribution network.
Biofuels and waste

General notes

In the 2024 edition, solar thermal data have been revised from 2008 onwards due to an improved estimation methodology adopted by the UK administration.

In the 2024 edition, the UK administration added small amounts of renewable aviation turbine fuel imports and blending with fossil fuels in bio-jet kerosene, since 2021.

In the 2024 edition, trade and consumption of biogasoline was revised by the UK administration from 2018 onwards due to new available information. In addition to bioethanol, from this edition biogasoline includes also biomethanol, MTBE and bio-petrol.

In the 2024 edition, the UK administration started reporting biodiesel used in power generation, in CHP plants and supplied to non-road mobile machinery (in not elsewhere specified industry) from 2018 onwards.

In 2023 edition, all series for industrial waste have been back corrected to 2008.

In the 2022 edition, solid biofuels data were revised back to 2008. This causes breaks in time series between 2007 and 2008. In the 2021 edition, revisions from 2015 onward in municipal wastes were reflect a reclassification from non-renewable to renewable based on the renewable portion of tires.

In the 2017 edition, the UK government revised the data time series for municipal waste and solid biofuels back to 2001. As a result, breaks in time series may occur between 2000 and 2001.

Transformation

Due to a change in sectoral allocation methodology, in the 2024 edition the UK administration revised consumption in several types of electricity and heat producers and in final consumption for industrial waste, municipal waste, biogases and primary solid biofuels for variable time periods, starting from 2008.

In the 2023 edition, gross and net electricity production from combustible fuels in autoproducer electricity plants was revised back to 2018. Breaks in time series – also for the electricity own use – may occur. From 2015, the UK administration...
started collecting data from the main-activity solar PV companies. Prior to this, all data were included under autoproducers.

The consumption of solid biofuels has increased in 2015, as the largest power station in the UK halfway through the year converted a further unit from coal to biomass, plus the previously converted unit had a full year of operation in 2015 rather than just the last few months of 2014.

Prior to 2013, due to data confidentiality reasons, one or two main-activity municipal waste plants had to be included within the autoproducer plant category. Since 2013, as there have been at least three main-activity companies, these plants have been reclassified from autoproducer plant to main activity electricity plant, with some CHP plants included under main electricity due to confidentiality reasons.

Consumption

In the 2024 edition, the UK administration added road transport consumption of biogases and small amounts of biopropane and biobutane in other liquid biofuels since 2018

In the 2023 edition, gross and net electricity production from combustible fuels in autoproducer electricity plants was revised back to 2018. Breaks in time series – also for the electricity own use – may occur.

In the 2022 edition, solid biofuels data were revised back to 2008. This causes breaks in time series between 2007 and 2008.

In the 2021 edition, solar thermal reclassifications from residential to commercial and public services in 2016 – 2018 represent new data on heating for public swimming pools.

In the 2020 edition, there are some unusual patterns in the industry sector for municipal wastes and solid biofuels, however revisions are expected in the following cycle.

In the 2018 edition, following a review of the consumption of biogases and municipal wastes for 2015 and 2016 data, data that were allocated to other sectors have been reallocated to the industry sectors. This has caused a break in time series between 2014 and 2015.
Electricity and heat

General notes
For the United Kingdom, it is necessary to combine figures for main activity producers and autoproducers in order to prevent the disclosure of information relating to less than three electricity generating companies, since this information is considered confidential. For this reason, data for main activity producer CHP plants have been included with autoproducer CHP plants from 1988. Prior to 1988, electricity output from CHP plants was included with autoproducer electricity plants.

The re-organisation and subsequent privatisation of the electricity supply industry in 1990 has resulted in some breaks in time series.

Supply
Data for off-grid solar PV are currently not available in the United Kingdom but the addition of this data is expected in the future.

Large declines in electricity generation from coal-fired power since 2013 are due to concrete plans to phase out coal use for electricity generation entirely by 2025. Alternative generation has been supplied by increases from other sources, including biomass, natural gas, nuclear, solar and wind generation, and increases in imports through undersea HVDC interconnectors.

Electricity production data for solar PV are available from 1999.

The launch of a feed-in-tariff scheme in April 2010 resulted in a rapid increase of capacity and corresponding electricity production growth from solar PV in the following years.

In 1996, the break in electricity production from nuclear is due to a reclassification of plants from autoproducer to main activity producer plants.

Data on electricity production from wind are available from 1989.

Transformation
In the 2023 edition, data on production from CHP plants were revised. As a result, breaks in time series (in particular for coal gases) may occur between 2018 and 2019.
In the 2022 edition, electricity generation from autoproducer wind plants was revised between 2018 and 2019. In 2019, a peak is visible because a large plant was recorded as an autoproducer and in 2020 it was classified as a main activity producer. The reason for this is that the plant was not covered by the survey of major power producers until 2020, therefore administrative data were used in 2019.

For 2021, the decrease in electricity output from nuclear was due to a high number of outages, and the commencement of defuelling at Dungeness B.

For 2019 onwards, the decline in output from other bituminous coal was due to plant closures (Fiddlers Ferry, Cottam, and Aberthaw).

For 2018-2020, the decrease in electricity output from nuclear was due to plant outages for maintenance.

Electricity used for pumped storage (mixed plants) is included under used for pumped storage (pure hydro pumping plants) for confidentiality reasons.

In 2007, outputs of electricity from petroleum coke are included in fuel oil.

Prior to 2003, all outputs of electricity and heat from oil products are reported in the other oil products category.

Heat production from autoproducers is available starting in 1999.

Inputs and output from natural gas for main activity producer electricity production are included in autoproducer electricity for 1990 (for reasons of confidentiality).

Consumption

For the 2019 edition, a change in methodology was applied for heat consumption figures from 2015 onwards. Due to new information regarding the purchasing and reselling of heat, consumption previously included under the Commercial and Public services sector was reallocated to the Residential sector.

For 2017, the decrease in electricity consumption in mining and quarrying is due to omission of one company from dataset.

Prior to 2010, consumption in mining and quarrying is included in the non-metallic minerals sector.

Electricity consumption in coal mines includes consumption in patent fuel plants.
Data for electricity consumption in transport was classified by sub-sector only starting from 2004 resulting in a break in time series between 2003 and 2004. Prior to 2004, non-specified transport includes consumption for traction by urban rails and road vehicles, and consumption for non-traction by railways and bus stations and airports. From 2004 onwards, road vehicles consumption is included under road transport. Prior to 2004, electricity consumption in rail refers to industrial rail only. From 2004 onwards it includes both industrial and urban rail.

Consumption in the machinery sub-sector includes that of the transport equipment industry before 1996.

Starting in 1990, small amounts of electricity used in heat pumps have been included in residential.

From 1984 onwards, the electricity consumption in the non-specified industry sector includes that of the wood and wood products sub-sector (except 2010-2014, when estimates were supplied by the UK) and unallocated consumption. The unallocated consumption comes from data reported as ‘Other industries’ by companies and includes Standard Industrial Classification (SIC) codes 7, 22, 31, 32, 33.19, 36, 38.3.

Electricity consumption in energy non-specified sub-sector is primarily made up of ‘gas and electricity supply’ and includes Standard Industrial Classification (SIC) codes 24.46 and 35. However, prior to 1990, consumption in gas works includes electricity use in the transmission/distribution of public supply gas.

For autoproducers, due to data availability constraints, heat is assumed to be consumed within the same sector as it is generated.
United States

Source

US Energy Information Administration, Washington D.C.

General notes

Starting with 2017 data, inputs to and outputs from electricity and heat generation include Puerto Rico.

End-use energy consumption data for the United States present a break in time series with historical data due to a change in methodology in 2014. The break in time series occurs between 2011 and 2012 for oil; and between 2001 and 2002 for electricity and natural gas. The new methodology is based on the last historical year of the most recent Annual Energy Outlook (AEO) publication. Changes occur primarily in reported end-use energy consumption in the industrial sector and its subsectors, including the non-manufacturing industries of mining, construction and agriculture. Historical revisions are pending. Due to other changes in reporting methodologies, there are numerous breaks in time series for the US data, particularly in 1992, 1999, 2001, 2002 and 2013. Care should be taken when evaluating consumption by sector since inputs of fuel to autoproducers are included in final consumption for some years. No data are available for most energy products in the construction and mining and quarrying industries.

Coal

General notes

The statistical difference for anthracite is significant for some parts of the time series as some consumption falls below the reporting thresholds, such as residential usage. Additionally, some anthracite is exported blended with other bituminous coal, and reported with the other fuel.

The decrease in coking coal and coke oven coke consumption for preliminary 2022 data is due to the ceasing of operations of several coking facilities and a blast furnace plant between 2021 and 2022.

In the 2023 edition, preliminary 2022 data for coke oven gas and blast furnaces gas are estimated by the IEA Secretariat.
In the 2023 edition, the IEA Secretariat revised the estimates for production, energy sector use and final consumption of *coke oven gas* and *blast furnace gas* in 2020 due to new available information.

From the 2022 edition, *coke oven gas* and *blast furnace gas* production and most consumption data are no longer available due to confidentiality.

Since the Energy Information administration (EIA) and the US Department of Commerce do not collect separate data on *patent fuel* exports by country, total exports data of *patent fuel* are included in the exports of *other bituminous coal*.

*Coal tar* as a by-product of coke ovens is not currently reported.

In 2002, the United States reported “synfuel” production as *patent fuel* for the first time. Prior to 2002, the consumption of this fuel was reported with *other bituminous coal*. Production ceased in 2007 for economic reasons.

*Hard coal* data prior to 1978 may include *sub-bituminous coal*.

**Supply**

*Other sources coal* production represents coal production that does not have a Mine Health and Safety Administration (MSHA) identifier.

*Other bituminous coal* exports could include some *anthracite* quantities. Anthracite is often blended with bituminous coal when exported.

**Transformation**

*Anthracite* calorific values for Main Activity & Other Uses is mainly Anthracite waste coal. As such heat content is much lower than expected for this product.

*Coking coal* calorific values for coke ovens and blast furnaces are reported by most data providers on an “dry heat content” basis rather than on an “as is” or “as received” basis. As such, they are on the higher end of the range expected for this product.

**Oil**

**General notes**

In the 2024 edition, the IEA secretariat revised data back to 2019 for *NGL* to reflect transfers of *NGL* to *crude oil* reported by the US administration. The quantity of *NGL* consumption has been reallocated to an interproduct transfer to *LPG* that is
then transferred to refinery feedstock and included in refinery intake. Revisions are expected next cycle to properly reflect this transfer from NGL to crude oil with the introduction of a new flow in the database.

In the 2018 edition, the US administration revised data back to 2011 for several products owing to the introduction of a number of methodological changes. This results in a number of breaks in the time series between 2010 and 2011, particularly in the consumption data.

From 2011 onwards, olefins are reported under other oil products instead of LPG.

Breaks in time series due to methodology improvements and newly available information to the US administration also appear in historical data: in 1990 for fuel oil (new methodology for marine bunkers); in 1992 for LPG/NGL (specific densities); in 1993 for oxygenates (new collection system to accommodate the revised Clean Air Act); in 1994 for motor gasoline (new model from the US Department of Transportation);in 1999-2000 for industry consumption (new available data from the 2002 MECS survey); in 2001 for fuel oil (changes in methodology for classifying imports of unfinished oils) and in 2011 for refinery gas (new density).

Supply

The US administration reports stocks of crude oil held in the United States on behalf of Australia under official agreement in 2020.

Receipts (from non-specified sources) and trade of additives/oxygenates in 2020 are not available as the EIA no longer collects information on ETBE and MTBE.

In the 2021 edition, receipts from other sources and total exports of additives/oxygenates have been estimated by the IEA Secretariat for 2019 based on information in the IEA Monthly Annual Oil Statistics.

In the 2021 edition, the refinery gross output of motor gasoline has been estimated by the IEA Secretariat for 2019 based on information in the IEA Monthly Annual Oil Statistics.

In the 2021 edition, deliveries of gas/diesel oil for international marine bunkers have been estimated by the IEA Secretariat for 2019 based on information provided by the EIA.
Deliveries to international marine bunkers of gas/diesel oil have been estimated by the IEA Secretariat for 2016 and 2017 based on information provided by the EIA.

In the 2018 edition, the breakdown of exports by destination of low sulphur fuel oil and high sulphur fuel oil is not available. The time series was revised back to 2011.

Completion of the Utopia pipeline from Ohio to Ontario has facilitated more ethane exports to Canada in 2018.

High statistical differences for crude oil represent “unaccounted for crude oil”, the difference between the supply and disposition of crude oil.

From 2013, the US administration reports exports of refinery feedstocks, some of which were previously reported under white spirit and SBP.

Stocks changes for gas/diesel oil, fuel oil and petroleum coke were estimated by the IEA Secretariat from 1996 onwards to include stock changes at utilities.

Transformation

From 2002 onwards, the IEA Secretariat has estimated the amounts of refinery gas used for autoproducer electricity production.

Consumption

In the 2024 edition, NGL consumption in the petrochemical industry was revised back to 2019 to reflect the transfer to crude oil reported by the US administration.

In the 2021 edition, consumption of motor gasoline for road transport and of gas/diesel oil for rail transport have been estimated by the IEA Secretariat for 2019 based on information provided by the EIA.

In the 2021 edition, non-energy use of gas/diesel oil in the chemical (including petrochemical) sector has been estimated by the IEA Secretariat for 2019 based on information provided by the EIA.

In the 2021 edition, consumption of petroleum coke in industry – not elsewhere specified has been estimated by the IEA Secretariat for 2019 based on information provided by the EIA.

In 2018 demand for petrochemical feedstocks derived from oil products increased following new ethylene production capacity coming online and the ramp up in polyethylene capacity. This trend is expected to continue through 2019 as further ethylene capacity comes online.
Between 2010 and 2011, end-use energy consumption data for the United States present a break in time series due to a change in methodology. For the period 2011-2016, quantities of non-energy use of LPG in chemical and petrochemical, and of other oil products in non-specified industry have been estimated by the IEA Secretariat.

From 2013 onwards, road use lubricants are reported under non energy consumption in transport equipment, machinery, and wood and wood products. Previously, such quantities were reported under non-specified industry.

From 1995 onwards, LPG inputs to gas works are included in industry.

**Natural gas**

**General notes**
Puerto Rico is currently not included in US data for natural gas with the exception of gas consumed for electricity generation. LNG imports into Puerto Rico are reported in the Other non-OECD Americas regional aggregate.

**Supply**
In the 2017 edition of this publication, the indigenous production data for 2014 was revised by the US administration creating a break in the time series between 2013 and 2014 due to a change in the methodology. In addition, this increased the statistical difference that remained high in 2015 and 2016.

The exports have been increasing since 2015, due to new liquefaction capacity (i.e. Sabine Pass) coming online at the end of that year.

**Transformation**
Since 2012, data reported under non-specified transformation represent natural gas used for hydrogen manufacture. Prior to 2012, these quantities are reported under the chemical and petrochemical sector.

Between 1999 and 2000, there are some breaks in time series for the transformation subsectors due to a new data reporting method.

Between 1990 and 2002, the amounts of gas works gas that are blended with natural gas have been estimated on the basis of the output efficiency of the process.
Since 1989, consumption by autoproducer CHP plants is available, while consumption by autoproducer electricity and main activity producer CHP plants is available since 1991. Prior to these years, these consumptions are included with industry and commerce/public services.

**Consumption**

Between 2009 and 2010 then 2020 and 2021 there is a break in the time series for construction due to a methodological change.

In the 2019 edition, revisions were made to the industry sector from 2015 onwards, by reallocating natural gas consumption to the chemical and petrochemical sub-sector from other industrial sub-sectors.

Due to revisions made to the iron and steel model, there is a break in the time series between 2014 and 2015 for the consumption in blast furnaces (energy).

Until 2001, agriculture/forestry consumption is included under industry.

From 1995 to 2001, the detailed breakdown of industry consumption is estimated by the Energy Information administration using the Manufacturing Energy Consumption Survey (MECS), which is conducted quadrennially.

Prior to 1995 a detailed breakdown of industry consumption is not available (between 1990 and 1994, chemical consumption is estimated by the American administration).

In 1991 data on natural gas use in the road sector were collected for the first time, and are not available for previous years.

Non-specified energy industry own use represents natural gas consumed for the production of ethanol.

Consumption in fisheries is included under industry.

**Biofuels and waste**

**General notes**

The EIA assumes all industrial waste is non-renewable.

In the 2023 edition, the biogasoline net calorific value time series has been revised since 2012 onwards. Previously, the gross calorific values were erroneously reported.
In the 2022 edition, **bio jet kerosene** appears for the first time for the year 2021. The values will be subject to revisions in future editions.

Due to the change in reporting methodology for **liquid biofuels**, breaks in time series occur between 2009 and 2010. This is especially noticeable in the **biodiesel** time series.

### Supply

Data for indigenous production and domestic supply of **industrial waste** have been estimated by the IEA Secretariat for 2019.

Data for production of **industrial waste** have been decreasing since May 2014 due to reclassification, resulting in a break in series between 2013 and 2014.

Indigenous production of **biodiesel** is estimated in 2010 based on the EIA’s Monthly Energy Report.

### Transformation

The EIA collects generation and consumption data from all plants 1 MW or more in capacity.

### Consumption

Due to an improved estimation, there are some breaks in time series of the industry sector and other sectors between 2009 and 2010: for industry, **geothermal**, **biogases** and **industrial waste** (paper, pulp and printing); for other sectors, **geothermal** and **solar thermal**.

In the 2024 edition, **biodiesel** consumption in the transport sector in 2022 is estimated by the IEA Secretariat.

### Electricity and heat

#### General notes

**Geothermal** supply and inputs to transformation data are estimated by the IEA Secretariat starting in 2009 because of efficiency discrepancies.

Between 2001 and 2002, there are breaks in time series concerning the total production of electricity and heat in the United States. Comprehensive data on electricity and heat production and consumption in main activity producer
electricity, CHP and heat plants and autoproducer electricity and CHP plants are not available for all years.

Supply
There is a break in series for geothermal and solar thermal direct use data between 2017 and 2018 as a new methodology for reporting these data was adopted with 2018 data. There is an additional break in series between 2018 and 2019e data for geothermal direct use, as the methodology has reverted to the previous one.

The IEA Secretariat estimated US solar PV electricity generation from autoproducers starting in 1999 by multiplying the dispersed and distributed PV capacity estimated by the US administration by an average capacity factor of 12%. The capacity factor was based on a report published in 2007 by the IEA Photovoltaic Power Systems Programme, Cost and Performance Trends in Grid-Connected Photovoltaic Systems and Case Studies. The corresponding consumption of electricity has been included under non-specified other.

Data for electricity inputs to and outputs from pumped storage hydro plants became available starting in 1987.

Discrepancies occur between respective reported figures for electricity trade between the US and Mexico from 2013 onwards, and between the US and Canada from 2016 onwards. This is in part due to a change in data source for US electricity trade figures, which creates a break in series between 2015 and 2016.

Transformation
Electricity inputs to both mixed hydro and pure pumped storage pumping plants are reported under inputs to pure pumped storage.

Offshore wind production began in 2016.

Beginning with 2016 data, the calculation for heat production in CHP plants has changed, resulting in breaks in time series. The United States administration is currently unable to apply this methodology to historic years, so will only cover heat data for 2016 onwards. As a result of this methodology change, several combustible fuel power plants have their overall efficiency values increased, recording increased heat production. The previous methodology existed for the years 2006 to 2015, so further breaks exist between 2005 and 2006.
For 2016, electricity and heat generation from some types of coal and some plant types were estimated by the IEA Secretariat, based on an initial submission from the US administration and subsequent reclassification of portions of this coal between coal types.

Accurate accounting of coke oven gas and refinery gas inputs is not always possible, which can lead to efficiencies of over 100% in main activity producer CHP plants.

Other sources electricity production represents purchased steam and waste heat from industries.

The low efficiencies from 2011 for other bituminous coal autoproducer electricity plants are due to the fact that one unit; the Albany Brewery Power Plant only produces unsold heat, and is reported in the wrong category of plant.

From 2007 to 2009, heat from industrial waste includes recovered heat from industrial processes. From 2010, the electricity produced from recovered heat is reported under other sources.

The decline in patent fuel used for electricity production in 2008 and subsequent cessation in 2009 is a result of the termination of the “synthetic fuel from coal” tax credit in 2008, which had been in the order of $20 to $25 USD per tonne, and while intended to deal with coal liquefaction and similar technologies, it had spawned an industry of cosmetic upgrading as a tax minimisation vehicle.

From 2004 to 2013, the EIA reported electricity and heat production from anthracite under other bituminous coal. The Secretariat estimated the split of generation output by fuel type based on the assumption that the plant efficiencies of the aggregate are equal to that of each part.

Starting in 2002, autoproducer electricity output for oil includes generation from refinery gases with a low average calorific value. Prior to 2002, this output was not accounted for.

Prior to 2001, some data on plants consuming sub-bituminous coal and lignite have been estimated by the Secretariat using information provided in the EIA’s Annual Electricity Generator Report – Utility.

Data for peat are confidential between 1994 and 1998 and from 2000 are not reported.

Prior to 2000, autoproducers include small and independent power producers which under IEA definitions are considered as main activity producers. Production
from these small and independent power producers accounts for about 25% of reported production of electricity by autoproducers in the United States. This reclassification causes breaks between 1999 and 2000.

In the 2003 edition, the United States administration reclassified some plants to autoproducers. This reclassification causes more breaks between 1998 and 1999.

From 1999 onwards, the fuel used in heat production by autoproducers is included in final consumption because the US administration cannot distinguish between the heat used directly on-site and the heat sold. Therefore, this may underestimate the heat sold to third parties.

Prior to 1999, solar thermal electricity production includes generation from natural gas because some natural gas units are attached to solar thermal plants and their production could not be separated.

Prior to 1991 some of the fuel inputs to electricity and heat production reported for autoproducer plants are reported as final consumption in the particular economic sector in which the autoproducer is operating.

Prior to 1989, there are no generation data available from autoproducers.

Sub-bituminous coal inputs for electricity and heat production are included in hard coal before 1983.

Consumption

Consumption breakdown data for electricity are modelled based on data obtained from the Annual Energy Outlook and conversion factors. These data are based on fiscal values rather than physical tonnage, so if commodity prices increase or decrease between AEO versions and the conversion factors are not updated, derived changes in consumption may appear that are not supported by physical changes in production, or actual changes in consumption. For example in 2016, production of steel in electric arc furnaces increased by 6%, however consumption of electricity in the iron and steel industry was reported as declining by 17%. In addition, as the AEO models are revised annually, but the historical data are not necessarily revised, regular breaks in-series can occur.

For the 2019 edition, the breakdown of final electricity consumption for 2017 was based on the results of the Annual Energy Outlook (AEO) of 2018. The model used in the 2018 edition of the Outlook was updated to incorporate the results of
the 2014 Manufacturing Energy Consumption Survey (MECS). The MECS values were last updated in 2010, and in the intervening period, several industries had changed significantly. For industry sub-sectors where disaggregated AEO2018 values are unavailable e.g. non-ferrous metals, textiles, and non-metallic minerals, consumption was extrapolated from the MECS 2014 values at the same rate as shipments in that industry. Breaks in time series occur across several sectors between 2016 and 2017.

Similarly, the breakdown of final electricity consumption for 2015 was based on the results of the Annual Energy Outlook (AEO) of 2016. Breaks in time series appear in the mining and agricultural electricity consumption sectors as a result of introduction of individual industry benchmarking for 2015 results. Changes in iron and steel, and pulp and paper data from 2014 to 2015 are the result of fundamental revisions of the iron and steel and pulp and paper models between AEO2014 and AEO2016 as well as the use of individual industry benchmarking for AEO2016. These changes are a few notable examples of series changes, and any series can change between AEO releases because of data updates and methodology changes.

Electricity consumption in road includes all estimated consumption by electric vehicles (both 100% and plug-in hybrids).

Prior to 1991, total consumption of heat sold referred to consumption in commercial/public services.

No data are available for heat sold that is consumed in the residential and agriculture/forestry sectors for any year.

Data for direct use of solar thermal heat in residential are available from 1999.

Since 1995, heat consumption data by sector are no longer collected, and have been estimated by the Secretariat, resulting in breaks in time series between 1994 and 1995, and 1999 and 2000.

Data for consumption of heat sold in industry are available from 1991 and in energy industry own use from 1992.
Non-OECD countries

General notes

In the references below, both the statistical year (2022) for which data are being published in this edition, as well as publication dates of the many documents which have been consulted during the development of this publication are mentioned. As a general rule, where specific documents or personal communications have been used, the date that is referenced is the date of publication of the document or the date of the communication, whereas, where data received through the completion of questionnaires are mentioned, the date that is referenced is the statistical year for which data are being published in this edition, namely 2022.

Data may not include all informal and/or illegal trade, production or consumption of energy products, although the IEA Secretariat makes efforts to estimate these where reliable information is available.

**Note:**

EU4Energy is a collaboration between the IEA, the European Union, Focus Countries and other implementing parties, designed to support the aspirations of Focus Countries to implement sustainable energy policies and foster co-operative energy sector development at the regional level. The EU4Energy programme is funded by European Union.

The first phase (2016-2022) was focused on the countries of the Eastern Partnership (EaP) and Central Asia: Armenia, Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Tajikistan, Turkmenistan, Ukraine and Uzbekistan.

The second phase (2021-2025) focuses solely on the six countries of the EU’s Eastern Partnership: Armenia, Azerbaijan, Belarus, Georgia, the Republic of Moldova, and Ukraine.

The UN database was used in a number of countries as a complementary data source.
Albania

General notes

Data for Albania are available starting in 1971.

Before 1993, large quantities of oil, widely reported to have moved through Albania into Former Yugoslavia, are not included in oil trade. Although they might have represented up to 100% of domestic consumption levels, no reliable figures for this trade are available.

Starting from 2011, motor gasoline consumption is reported in the residential sector. This consumption corresponds to motor gasoline used in electricity generators.

IEA Secretariat estimates.
Algeria

General notes

Data for Algeria are available starting in 1971.

Crude oil production and export data do not include field condensate. Field condensate quantities are included with natural gas liquids.

Heavy crude oil was imported until 2019 for the production of bitumen. This is included in the crude oil series. Other non-specified oil products include ethylene, white spirit, aromatics and very small quantities of aviation gasoline. MTBE is imported since 2020 as an additive for gasoline.

In the 2024 edition, information from Ministry of Energy and Mining and Sonatrach led to the revision of natural gas stock changes and use in transport between 2013 and 2021, jet kerosene imports from 2020 onwards and the inclusion of MTBE data in additives from 2020 onwards (2022 data is estimated by the IEA Secretariat). Electricity use in oil and gas extraction is reported for the first time in the 2024 edition (2022 data only). Bitumen, lubricants and other non-specified oil products data has been revised from 2015 onwards, reflecting newly available information from Sonatrach, AFREC, UN Comtrade and IEA Secretariat estimates. For this reason, a structural break in data is possible between 2014 and 2015.

In the 2024 edition, newly available information led to the inclusion of a new refinery feedstocks series from 2013 onwards. This series includes the reutilization of naphtha for the improvement of condensate and does not include imports of heavy crude oil that took place until 2019 for the production of bitumen. In previous editions, both these quantities were included in crude oil intake. For this reason, crude oil and naphtha series were revised from 2013 onwards.

In the 2021 edition, newly available information lead to the report of the split between international marine bunkers and domestic navigation for the first time.

In the 2021 edition, new use of official data on final consumption of natural gas led to revisions in the breakdown by detailed industries between 2014 and 2018. This may cause breaks in time series between 2013 and 2014.

In 2018 Sonatrach, the national oil and gas company, acquired a refinery in Italy. Crude oil input and refined oil products output, such as gas oil and gasoline, from this facility may be included in Algeria’s national production for 2018 and the first half of 2019. This activity stopped for the second semester of 2019.
In the 2015 edition, revisions were made to the energy balances in 2009 and 2010 which add more detail for certain products and flows. This may result in breaks in time series between 2008 and 2009.

IEA Secretariat estimates.
Argentina

General notes

Data for Argentina are available starting in 1971.

In the 2021 edition, new use of customs information led to revisions of coal imports between 2002 and 2018.

In the 2020 edition, Argentina’s 1971-2017 time series were revised across all products after communication of revised historical balances from Secretaría de Energía. Most of the revisions are based on those revised energy balances; others are based on revisions from the IEA Secretariat after analysis of available historical balance series. In detail:

Coke oven coke, coke oven gas and blast furnace gas data are estimated by the IEA Secretariat from 2006 onwards.

Petroleum coke demand is estimated by the IEA Secretariat from 2006 onwards, and trade is sourced from Instituto Nacional de Estadística y Censos de la República from 2006 onwards.

Data on electricity demand by industrial sub-sector is available since 2015. However, it reflects fixed shares of demand by sub-sector and does not reflect variation of demand trends between sub-sectors over time. Electricity generation by fossil source is estimated by the IEA Secretariat based on information of fuel inputs and generation by technology.

Biogas data includes biogases from thermal processes in the paper industry up to 2013, and electricity generation data reported by CAMMESA from 2012. Refinery feedstocks data is available from 1999.

Additives data contains MTBE from 1994 and other octane improvers from 2010 onwards. A structural break may exist between 2009 and 2010. Natural gas data contains trade of wet gas and own use of wet gas in oil and gas extraction. This can lead to statistical differences in the time series.

The Secretaría de Energía is developing its statistical system to collect further data on final consumption data and its disaggregation by activity. This could lead to data revisions or breaks in time series in future editions.

Since 2010 a different methodology was adopted by Argentina for reporting refinery flows leading to more detailed information (e.g. reprocessing of some oil products). This may result in breaks in time series between 2009 and 2010. Breaks
in time series may also exist between 1993 and 1994 due to the start of the data series coverage of such refinery flows.

Azerbaijan

General notes

Data for Azerbaijan are available starting in 1990. Prior to that, they are included in Former Soviet Union.

Azerbaijan is one of the 11 EU4Energy focus countries.

Field condensates from Azerbaijan’s Shah Deniz field are reported together with NGLs.

Azerbaijan natural gas data are reported at temperature and pressure of 20°C and 101.325 kPa, respectively.

Natural gas production data may differ from Azerbaijan national energy balance. Natural gas produced and used in the oil and gas extraction industry is counted by the IEA Secretariat in natural gas production.

In the 2024 edition, electricity production from autoproducer electricity plants was reallocated from residential to commercial and public services for the entire timeseries.

In the 2023 edition, the State Committee of Statistics and the Ministry of Economics of Azerbaijan did not report any value for Natural Gas flared due to unavailability of the national data sources used in previous years. This creates a break in the time series between 2020 and 2021 for this flow.

In the 2021 edition, net calorific values (NCVs) reported by Azerbaijan for oil were used to convert physical data to energy units. In previous years, IEA standard NCVs were used. As a result, the time series of primary and secondary oil products were revised for varying periods between 1990 and 2018.

Breaks in time series appear for inputs and outputs of electricity, CHP and heat plants in Azerbaijan between 2006 and 2007 due to an improved data collection methodology in the country from 2007 onwards.

For the purpose of calculating CO₂ emissions, an allocation between domestic and international aviation consumption of jet kerosene was estimated by the IEA Secretariat for 1990-2006 based on total aviation consumption reported by Azerbaijan and the 2007 allocation.

A break in time series may be observed between 2015 and 2016 consumption data due to a household consumption survey.
Sources

Sources 1990 to 2022:
Direct communication with the State Committee of Statistics and the Ministry of Economics of Azerbaijan, Baku.

Sources for biofuels and waste:
Bosnia and Herzegovina

General notes

Data for Bosnia and Herzegovina are available starting in 1990. Prior to that, they are included in Former Yugoslavia.

In the 2023 edition, efforts have been made with Agency for Statistics of Bosnia and Herzegovina to improve the statistics of blast furnaces. Current data results in unusually low efficiencies, and we expect revisions of these values in the 2024 edition.

In the 2022 edition, disaggregated coal data became available between anthracite, other bituminous coal and coking coal. This also includes break down information on consumption flow data such as energy industry own use of blast furnace gas. This led to a break in the time series between 2019 and 2020.

In the 2022 edition, there was a break in the time series between 2019 and 2020 data for the input of combustible sources and its electricity and heat production from autoproducers. This was a result of an error in recognition of autoproducer from industry in the chemical and petrochemical sector that was corrected in C2022 for 2020 with the plan for analysis and correction/revision of historical data.

In the 2021 edition, the net calorific values (NCVs) of crude oil reported by Bosnia and Herzegovina were used to convert physical data to energy units. In previous editions, IEA standard NCVs were used. As a result, the time series of crude oil in energy units was revised from 2014 onwards.

In the 2021 edition, crude oil and oil products data are affected by the overhaul works in the refinery of Brod. This might result in breaks in time series between 2018 and 2019.

In the 2020 edition, solid biofuels modelling by the Ministry of Foreign Trade and Economic Relations led to new data starting in 2018. A break in time series may occur between 2017 and 2018. Revisions for historical data may be communicated in the future.

In the 2019 edition, data on electricity, CHP and heat were submitted by the Agency for Statistics of Bosnia and Herzegovina.

In the 2018 edition, data on blast furnace gas and coke oven gas production became available for 2016. Also, the calorific values of coking coal and coke oven
coke were revised for 2014-2016. This may result in breaks in time series on the efficiencies of blast furnaces and coke ovens between 2013 and 2014.

In 2018, BHAS received technical expertise from the IEA Secretariat and reallocated inputs of sub-bituminous coal to electricity, CHP and heat plants to lignite for the period 2014-2016. This may lead to breaks in time series between 2013 and 2014.

In 2015, BHAS conducted their first household survey on biomass consumption. Due to this newly available data, breaks in time series may occur between 2013 and 2014. In order to further improve the biomass data quality, they revised data for the period 2014-2016.

In 2014, BHAS conducted their first survey on oil product consumption. Breaks in time series may occur between 2012 and 2013.

Until 2012, the source for crude oil and secondary oil products data is the publication “Industrial Production Bosnia and Herzegovina 2012” and “Oil Trade Data” both produced by the Agency for Statistics of Bosnia and Herzegovina.

Energy statistics are available from the Agency for Statistics of Bosnia and Herzegovina (BHAS) from 2008 for electricity and heat and from 2009 for coal and natural gas. As a consequence, breaks in time series may occur between 2007 and 2008 for electricity and heat and 2008 and 2009 for other products.

Brazil

General notes

Data for Brazil are available starting in 1971.

Brazil joined the IEA as an Association country in October 2017.

Although IEA’s balance is based on Brazil’s national statistics, differences with the national energy balance can be observed due to the different methodologies adopted for reporting nuclear, chemical heat, natural gas, NGL production, non-energy use and production process of liquid biofuels, renewables, blast furnaces and coke ovens.

Crude oil data includes small amounts of oil shale.

The split between domestic and international marine bunkers is done based on flag (nationality) of ships.

In the IEA balance for Brazil, “Biogasoline” refers to anhydrous ethanol while “Other liquid biofuels” refers to hydrated ethanol. The national energy balance of Brazil shows bioethanol as two separate products: anhydrous ethanol ("álcool anidro", i.e. nearly pure ethanol, containing less than 1% of water) and hydrated ethanol ("álcool hidratado", i.e. a blend of ethanol and water, in the proportion of about 95% to 5%, generally obtained from conventional distillation). While anhydrous ethanol is blended with gasoline (the blend sold at the pump generally contains 27% of ethanol), hydrated ethanol is sold at separate pumps as a product by itself (álcool) to be used in flex fuel cars, i.e. vehicles that can run on any mix of gasoline and ethanol.

Allocation of consumption to subsectors in national energy statistics is done according to the National Classification of Economic Activities (CNAE). Energy consumption in the tobacco, construction, transport machinery and machinery sectors is included in “other industries” in national data, which is allocated in the IEA Balance to non-specified industry. As such, consumption in the food and tobacco sector excludes the tobacco sector.

In the 2023 edition, the Ministry of Mines and Energy provided Solar Thermal data for the period 1982-2022. Previous IEA Secretariat estimations were revised, and all data for this product are official from this edition on.

In the 2023 edition, the Ministry of Mines and Energy revised historical data for Natural Gas, Diesel Oil and Electricity consumption in the Oil and gas extraction
sector. These data have been revised in our publications since year 2014, and revisions for previous years are expected in coming editions.

In the 2022 edition, close cooperation with the Ministry of Mines and Energy led to a revision in biogasoline and other liquid biofuels losses. These are now exceptionally taken into account with the objective of reducing statistical difference. The key changes are that they now include losses in evaporation, leaks, accidents during the process of production and storage in addition to distribution losses.

In the 2021 edition, close cooperation with the Ministry of Mines and Energy also led to a series of revisions affecting oil and gas data, enhancing harmonization of IEA data with national energy balances. The quantities of refinery input and output now reflect those reported by the Ministry of Mines and Energy more accurately. Wet gas losses in gas separation plants are now excluded from NGL production, leading to revisions from 2011. Production of LPG and motor gasoline was also revised to exclude the quantities resulting from naphtha processing by the petrochemical industry, which are now included in transfers. The calorific values of natural gas, other non-specified oil products and natural gas liquids have also been revised. As a result of these changes, production and transfers have been revised for LPG, motor gasoline and other non-specified oil products since 1971. Refinery feedstocks have also been revised from 1971, with significantly lower levels of refinery input.

The national energy balance of Brazil reports quantities of “Other non-renewable” energy consumed by the chemical, cement, iron and steel, and other sectors for both final consumption and autoproducer CHP generation. This combines a series of energy sources, such as tyre scrape, clay, blast furnace dust, tail gas, residual gases, sulphur gases and other residues. Starting with the 2021 edition, these products and their corresponding electricity generation are allocated to industrial waste, except for the power inputs of the chemical sector, which are allocated to heat from chemical sources. This leads to a structural break in 2017, as generation from such energy sources in the iron and steel was not separated from blast furnace gases before 2017.

In the 2021 edition, biogases from thermal processes include the amount of blast furnace gases from charcoal, and the corresponding electricity generated from those gases, from 2012 onwards.

In the 2020 edition, new information became available, leading to revisions to 2016, 2017 and 2018 data in coal, gas oil and electricity. Data on biogas in transformation processes has been revised since 2008, oil product densities since

2014, and biodiesel and diesel data since 2011. Transfers of fuel oil and lubricants have been revised since 2012.

In the 2015 edition, new information became available which explains the types of product transfers within Brazilian refineries. The IEA attempted to reflect these transfers as accurately as possible.

Brazil produces a large share of its pig iron in blast furnaces that are fuelled and fed with charcoal. The blast furnace gases produced when charcoal is used as a reagent in the blast furnaces are renewable products and they have been reported in this publication under the product “Biogases from thermal processes”. Additionally, only the part of these gases consumed for power generation (i.e. energy purposes) has been accounted for in the transformation sector. The remaining charcoal consumed in or used to heat the blast furnaces is reported in final consumption under the iron and steel industry with no distinction between transformation and final consumption.

Prior to the year 2000 blast furnace gases data availability is limited to the input to auto producer electricity plants. Therefore, from 1971 to 1999, the other flows (e.g. production, consumption etc.) are IEA Secretariat estimates.

The Itaipu hydroelectric plant, operating since 1984 and located on the Paraná River (which forms the border of Brazil and Paraguay) was formed as a joint venture between Eletrobrás and the Paraguayan government. Production is shared equally between Brazil and Paraguay.

**Sources 1971 to 2022:**

Direct communication with the Ministério de Minas e Energia, Brasília.

*Sistema de Informações Energéticas (SIE Brasil), Ministério de Minas e Energia, Brasilia, accessed in April 2024,* [https://www.mme.gov.br/SIEBRASIL/](https://www.mme.gov.br/SIEBRASIL/)
Bulgaria

General notes

Data for Bulgaria are available starting in 1971.

In the 2024 edition, new autoproducer electricity plants were reported in the industry sector following a pilot annual survey to collect solar PV production and capacity data from autoproducer plants.

In the 2022 edition, useful heat produced by nuclear plants was reclassified from CHP to heat only. Therefore, all nuclear main activity producer CHP plant input and output has been moved to nuclear main activity producer heat plants for the entire time series (1994-2019).

In the 2021 edition, the status of Bulgaria’s crude oil indigenous production data was changed to confidential. A break in the time series may occur between 2018 and 2019.

In the 2021 edition, net calorific values (NCVs) reported by Bulgaria were used to convert physical data to energy units. In previous years, IEA standard NCVs were used. As a result, the time series of primary and secondary oil products were revised for varying periods between 1991 and 2018. Coal NCVs were also revised from 2015 to 2018. Breaks in the time series may occur.

Data on the use of refused derived fuel (RDF) are included in Bulgaria’s waste statistics since the 2020 edition. Thereby, the renewable part of this fuel is allocated to renewable municipal waste, while the non-renewable part is allocated to industrial waste. In the 2021 edition, more information on these renewable waste components became available from 2018, resulting in the reclassification of some non-renewable industrial waste. As the combustion of waste for power generation in Bulgaria is experimental, breaks in the time series may occur. The National Statistical Institute is currently reviewing their methodology for this reporting.

Non-specified transformation of natural gas to other hydrocarbons corresponds to hydrogen used in refineries.

Bulgaria has re-classified black liquor from industrial waste to solid biofuels and the renewable portion of tyres from industrial waste (non-renewable) to solid biofuels (industrial waste – renewable part) from 2008. Breaks in time series may occur between 2007 and 2008.
A break in the time series for natural gas stock changes may occur between 2003 and 2004 as cushion gas is excluded from 2004 onwards.

People’s Republic of China

General notes

Data for the People’s Republic of China (China) are available starting in 1971.

China joined the IEA as an Association country in November 2015.

In the 2021 edition, following results from the economic census, NBS supplied the IEA with revisions to their 2014 – 2017 energy data, as well as their 2018 data. The IEA Secretariat revised its data accordingly. All revisions showed rather small changes both on the supply and demand side for a number of energy products.

Between September 2015 and early 2016, NBS supplied the IEA with revised energy balances for 2000 to 2013 and the IEA revised its data accordingly.

All revisions showed significant changes both on the supply and demand side for a number of energy products, resulting in breaks in time series between 1999 and 2000.

Coal

NBS and IEA collaborate to provide additional detail on energy production, transformation and consumption of all five different types of coal (e.g. anthracite, coking coal, other bituminous, sub-bituminous and lignite). At the moment NBS only provides quantities of raw coal and washed coal (split between cleaned coal and other washed coal) in their energy balances and the IEA Secretariat has attributed these quantities to coking coal and other bituminous coal. It is expected that the continuing work to provide disaggregated data on the five different coals will result in greater detail in future editions.

In the 2018 edition, NBS changed the definition of cleaned coal and other washed coal. Only the coal used for coking is called cleaned coal. This might result in breaks in time series in coking coal between 2015 and 2016. As this change of methodology resulted in uncertainty on the use of cleaned coal, the IEA Secretariat estimated the use of coking coal in transformation and final consumption sectors.

In the 2018 edition, based on new information, coal consumption in rail was revised for the whole time series to reflect the fact that coal is used for other usages than transport in the rail sector. The IEA Secretariat has allocated part of the coal reported under rail to other non-specified sectors for the period 1990-
2003. For the period 2004-2016 the IEA Secretariat allocated the total amount of coal reported under rail to other non-specified sectors.

In the 2018 edition, based on new information, coal inputs to main activity heat plants and part of coal inputs to main activity electricity plants were allocated to main activity CHP plants for the period 2005-2016.

Net calorific values (NCV) for coal inputs to power generation from 2000 are estimated by applying assumptions used by China on the average thermal efficiency of coal-fired power stations in these years. NCVs are also estimated for bituminous coal production from 2000 as well as for inputs to main activity CHP plants from 2008.

Since 2000, imports and exports of cleaned coal are no longer reported in the national energy balance of China. The IEA Secretariat has used secondary sources of information to report this coking coal trade and corresponding quantities have been removed from bituminous coal trade. Consumption of this coking coal is assumed to be in coke ovens.

The IEA data of coal stocks for the years 1985 and 1990 as well as coal production for the years 1997-1999 are estimates and do not represent official data released by the Chinese government. Those estimates were based on the assumption that coal consumption statistics are more reliable than coal production statistics and that the production-consumption relationship should maintain a balance over time. In recent years, China has reported large increases in stocks for different types of coal. These stock increases are seen as consistent with trends in economic growth and development in China; however, information is currently lacking on the scale of the infrastructure available for this magnitude of stock increases.

Data for coal trade in this publication may not match data from secondary sources of information.

Oil

Starting with 2010 data, NBS increased the level of detail of the national energy balance regarding oil products and coal gases. Breaks in time series may occur between 2009 and 2010.

In 2012, new information became available on how NBS accounts for international aviation and marine bunkers in the China’s national energy balance. Previously international flights by Chinese airlines and ships had been excluded. A revised methodology was implemented that includes fuel use for international airplanes and ships, regardless of whether they are foreign- or China-owned.
Coal to liquids output was estimated based on projected production slate of operational coal-to-liquid plants.

In recent years, China has reported large increases in stocks for crude oil and oil products. These stock increases are seen as consistent with trends in economic growth and development in China; however, information is currently lacking on the scale of the infrastructure available for this magnitude of stock increases.

In the 2022 edition, a new methodology was developed to adjust refinery yields to crude oil inputs to refinery. The refinery losses have been revised with this implementation.

In the 2022 edition, jet kerosene international aviation bunkers were adjusted in line with the decrease in emissions observed for international flights. Similarly, jet kerosene consumption in the domestic aviation sector was also adjusted to mirror the decrease observed in emissions from domestic flights.

**Natural gas**

In the 2018 edition, based on new information, natural gas inputs to main activity heat plants and part of natural gas inputs to main activity electricity plants were allocated to main activity CHP plants for the period 2005-2016.

In the 2012 edition, information became available on natural gas consumption in public transportation in China. This consumption was added to the natural gas time series to ensure proper coverage of the transport sector.

Coal to gas output is estimated based on operational capacity of coal-to-gas plants.

**Biofuels and waste**

Due to lack of data availability, residential consumption of biogases is set equal to 2018 values for years 2019-2022.

In the 2024 edition, estimates of residential consumption of primary solid biofuels were revised from 2019-2022 to reflect trends in population with primary reliance on biomass for cooking as published by the World Health Organization.

In 2016, the IEA has been working with the Institute of Built Environment of Tsinghua University, Beijing, to improve its data on biomass consumption in the residential sector in China. Biomass figures have therefore been revised in the 2016 edition back to 1997 to reflect the results of their study and of IEA analysis.
Information became available in 2012 from NBS on the production and consumption of gangue, a mining waste product that has been classified as industrial waste in the IEA energy balances. This quantity of industrial waste is not likely to represent the only combustion of industrial waste in China; however, information is not available to provide more complete data on this activity.

Time series for liquid biofuels and biogases are based on secondary sources of information and IEA Secretariat estimates. None of these time series are reported in the national energy balance of China.

**Electricity and heat**

In the 2023 edition, electricity consumption in road transport was revised from 2000-2020 based on latest IEA Secretariat estimates.

In the 2018 edition, based on new information, heat production from main activity heat plants using coal and natural gas and part of electricity production from main activity electricity plants using coal and natural gas were attributed to main activity CHP plants from 2005 onwards.

Estimates on the electricity consumption in road transportation are included, starting with 2001 data.

Electricity production from pumped storage hydro is reported from 2010 onwards.

Time series for wind (prior to 2010), geothermal, solar photovoltaic and solar thermal generation are based on secondary sources of information and IEA Secretariat estimates. None of these time series are reported in the national energy balance of China.

IEA Secretariat estimates.
Croatia

General notes

Data for Croatia are available starting in 1990. Prior to that, they are included in Former Yugoslavia.

Non-specified transformation of natural gas reported from 2007 refers to natural gas used by refineries for hydrogen production.

Breaks in time series may appear between 2007 and 2008 as transit data of electricity trade are not available for years prior to 2008.

In 2022, the Croatian government reduced fees paid by fuel distributors for not placing biofuels of the market which caused an important decrease of biofuels deliveries.

In 2022, the share of refinery output by product is different from historical years due to the upgrading of technological processes within the Rijeka refinery.

In the 2023 edition, the Croatian Energy Institute Hrvoje Požar revised several products and flows across all fuel questionnaires from 1990 to better align with international recommendations for energy statistics.

The 2021 publication includes revisions to oil products consumption and to electricity and heat data across the whole time series based on new information available.

Direct communication with the Central Bureau of Statistics, Zagreb.

Joint IEA/Eurostat/UNECE annual energy questionnaires.

IEA Secretariat estimates.
Curaçao

General notes

Data for Curaçao are available starting in 1971.

Refinery inputs and outputs are estimated based by the IEA Secretariat. Similarly, oil demand is estimated based on economic indicators of the region. The decrease in estimated consumption of non-bio gasoline from 2020 onwards is driven by a decrease in the number of registered road vehicles following the COVID-19 pandemic.

In the 2022 edition, some supply and demand flows of gasoline, gas/diesel, fuel oil, lubricants and other non-specified oil products have been revised from 1997 onwards due to new available information on economic indicators of Curaçao.

Since 2021 edition, the IEA Secretariat estimated oil data for Curaçao from 2017 onwards since no official data on the operations of the Isla refinery were available by the time this publication was prepared. It was assumed based on IEA Secretariat expert’s sources, that the refinery has been idle since the beginning of 2019.

In the 2020 edition, oil data between 2011 and 2016 as well as crude oil refinery input for 2017 were revised to better reflect available Petróleos de Venezuela, S.A (PDVSA) data and to include trade information for petroleum coke and bitumen. The Isla refinery did not operate for most of 2018, leading to a significant reduction in refinery activity.

In the 2020 edition, new information from Aqualectra led to revisions from 2012 onwards to electricity generation from fossil sources and wind, as well as electricity demand and diesel/fuel oil inputs to power generation.

In the 2018 edition, new sources became available that led to revisions of the solar PV and wind data. This might lead to a break in time series between 2011 and 2012.

The Netherlands Antilles was dissolved on 10 October 2010, resulting in two new constituent countries, Curaçao and Sint Maarten, with the remaining islands joining the Netherlands as special municipalities. The methodology for accounting for the energy statistics of the Netherland Antilles has been revised in order to follow the above-mentioned geographical changes. From 2012 onwards, data now account for the energy statistics of Curaçao Island only. Prior to 2012, data remain
unchanged and still cover the entire territory of the former Netherland Antilles. This leads to breaks in time series between 2011 and 2012.

As the Isla refinery did not operate to its maximum capacity in 2010, a break in time series might occur in that year for crude oil and oil products.

IEA Secretariat estimates.
Cyprus

General notes

Note by the Republic of Türkiye (Türkiye):

*The information in this document with reference to “Cyprus” relates to the southern part of the Island. There is no single authority representing both Turkish and Greek Cypriot people on the Island. Türkiye recognizes the Turkish Republic of Northern Cyprus (TRNC). Until a lasting and equitable solution is found within the context of the United Nations, Türkiye shall preserve its position concerning the “Cyprus issue”.*

Note by all the European Union member states of the OECD and the European Union:

*The Republic of Cyprus is recognized by all members of the United Nations with the exception of Türkiye. The information in this document relates to the area under the effective control of the government of the Republic of Cyprus.*

Data for Cyprus are available starting in 1971.

In the 2022 edition, the entire time series (2007-2019) of geothermal indigenous production and final consumption in the residential sector were reclassified from geothermal energy to ambient heat by Cyprus. Consequently, these data are no longer represented in the energy balance or statistics.

In the 2021 edition, net calorific values reported by Cyprus were used to convert physical data to energy units. In previous years, IEA standard net calorific values were used. As a result, the time series of liquefied petroleum gases, kerosene type jet fuel excluding biofuels, other kerosene, gas/diesel oil excluding biofuels, fuel oil, lubricants, bitumen, and petroleum coke were revised from 1990-2018. Breaks in the time series may occur between 1989 and 1990 for these products.

In the 2020 edition, the time series of primary solid biofuels were revised from 2009-2010 based on newly available information. Breaks in the time series may occur between 2008 and 2009 for these products.

IEA Secretariat estimates.
Ecuador

General notes

Data for Ecuador are available starting in 1971.

Crude oil production and export data do not include field condensate. Field condensate quantities are included with natural gas liquids.

In the 2023 edition, data from 2012 onwards was revised to reflect revisions to official data from Ministerio de Energía y Minas. In particular, revisions were made to natural gas production and flaring (2017 to 2021), crude oil imports (2021), electricity data (2021), refinery gas production and own use (2012 to 2021), gasoline production (2014) and new data on petroleum coke imports and consumption (new series from 2012 onwards). Petroleum coke data from 2003 to 2011 in this new series is sourced from the United Nations Comtrade database. Electricity generation from fuel oil (main activity) and diesel (autoproducers) was also revised from 2015 onwards so that total electricity generation in Ecuador matches the data of Ministerio de Energía y Minas.

In the 2022 edition, 2018 and 2019 data for Ecuador were revised to reflect revisions of official data from the Instituto de Investigación Geológico y Energético. This may lead to breaks in the time series between 2017 and 2018. In particular, the biggest changes regard refinery gas production and use and diesel and fuel oil final consumption in industry and commercial and public services.

In the 2020 edition, data for Ecuador were revised for the years 2000 to 2006, following revision of official data from the Instituto de Investigación Geológico y Energético. This may lead to breaks in the time series between 1999 and 2000. Revisions also include non-energy use of oil products between 1992 and 1999 as new information became available.

In the 2019 edition, data for Ecuador were revised for the years 2007 to 2016, following revision of the official data from Instituto de Investigación Geológico y Energético for national and international bunkers for oil products.

In the 2019 edition, solid biofuels data for the years 2007-2016 were revised. This leads to different figures compared to previous editions.

Egypt

General notes

Data for Egypt are available starting in 1971.

Data are reported on a fiscal year basis. Data for 2022 correspond to 1 July 2022 - 30 June 2023.

In the 2024 edition data new information from CAPMAS became available to the IEA Secretariat leading to revisions of the entire balance for 2020 and 2021.

In the 2024 edition, breakdown of electricity consumption by sector is available from 2020 onwards.

In the 2023 edition data was revised for the year 2021 and 2020 to respect the fiscal year basis reporting of Egypt for secondary oil products and hydropower production.

Stock changes may include informal trade.

In the 2022 edition, new information from CAPMAS became available to the IEA Secretariat, leading to revisions in primary and secondary oil data for years 2018 and 2019 as well as coal data for the same period. Trade data for these product aggregates has also been revised for the period 2014-2019.

In the 2022 edition, electricity output from natural gas plants was revised for the period 2008-2019 as new information regarding private sector power plants was collected by the IEA Secretariat.

In the 2022 edition, natural gas final consumption in road transport was revised for years 2018 and 2019 using new information provided by EGAS.

In the 2021 edition, new information became available to the IEA Secretariat, leading to revision of trade and production for primary solid biofuels and charcoal for the whole time series.

In the 2021 edition, due to a more accurate use of official data, gas condensate data have been revised from 2014 to 2018.

In the 2020 edition, the IEA Secretariat revised primary solid biofuel data back to 1971. Data are now based on the Food and Agriculture Organisation (FAO), growth of solid biofuels production and consumption. Charcoal production, trade and use have been estimated based on FAO data.
In the 2020 edition, importation and consumption of other bituminous coal have been revised for the years 2014 to 2017, as new information became available. This may lead to break in time series between 2013 and 2014.

In the 2020 edition, input of natural gas to power plants as well as natural gas final consumption in 2017 were revised based on new data received from CAPMAS and EGAS.

In the 2014 edition, the IEA Secretariat has revised marine bunkers back to 2004. Data from 2004 are now based on data received from the Egyptian Authorities.

Georgia

General notes

Data for Georgia are available starting in 1990. Prior to that, they are included in Former Soviet Union.

Georgia is one of the 11 EU4Energy focus countries.

Energy data for Georgia do not include Abkhazia and South Ossetia, except for the electricity questionnaire. Part of the electricity generated in the Enguri HPP is transferred to Abkhazia and accounted for in the electricity balance as non-specified consumption.

In 2015, a refinery started operating in Georgia.

For the period 2015-2017, trade of crude oil includes a share of crude oil blended with fuel oil. This explains breaks in time series from 2014.

In 2015, trade of natural gas for the year might include re-export.

Between 2014 and 2015, a break in stock level time series appears for some oil products as the National Statistical Office (GEOSTAT) received more detailed information on stocks of oil products.

Between 2012 and 2013, breaks in time series may appear for some products, as data collection and submission to the IEA became the responsibility of the National Statistical Office (GEOSTAT), whereas it used to be done by the Energy Efficiency Centre.

For the period 1990-2012, natural gas data are reported at temperature and pressure conditions of 20°C and 101.325 kPa, respectively.

Since 2011, heat production has stopped due to the shutdown of combined heat and power plants.

Ghana

General notes

Data for Ghana are available starting in 1971.

Ghana is one of the ten countries that benefit from EU Support to IEA Data for Affordable and Sustainable Energy System for Sub-Saharan Africa.

In the 2024 edition, revisions to data between 2017 and 2021 took place based on energy balance sheets from the Ghana Energy Database System. As a result of these revisions between 2017 and 2021, data was added for LPG stock changes, transformation in the power sector and use in transport, gasoline/kerosene/jet kerosene stock changes and gas/diesel oil and fuel oil stock changes and own use. In 2021 and 2022, no imported crude oil was used in Tema refinery or for electricity generation. In 2022, the state-owned Tema refinery did not operate. 2022 refinery intake of crude oil by privately-owned refineries is estimated by the IEA secretariat. Bitumen data was revised from 1996 onwards with updated imports data from the UN Comtrade database.

Production from the TEN field started in 2016 and from the Sankofa Gye Nyame (SGN) field in 2017. Two new producing wells were added to the SGN field in 2019. Breaks in time series might occur between 2016 and 2017 in crude oil production, and between 2018 and 2019 for natural gas production.

In the 2022 edition, international marine bunkers and exports of gas/diesel oil (2017-2019) were revised to match data published by the Energy Commission. Imports (2015-2019) and industry consumption (2017-2019) of fuel oil were also revised based on new data in Energy Commission publications.

In the 2019 edition, fuelwood time series from 2008 to 2016 were revised as Ghana published new data. Breaks in time series might occur between 2007 and 2008.

In 2014, Ghana started to exploit gas that was previously flared.

In the 2015 edition, primary solid biofuels figures for 2000-2012 were revised, as new information became available. Breaks in time series might occur between 1999 and 2000.

In the 2014 edition, data were revised for electricity, oil products and biofuels until 2000 and from 2009 to 2012 based on new information received from the Energy Commission. Breaks in time series may occur for these products.

In 2011, Ghana began oil production from the Jubilee fields, resulting in a change in crude production and exports between 2010 and 2011.

Honduras

General notes

Data for Honduras are available starting in 1971.

In the 2024 edition, information from the Central Bank of Honduras external trade system (SICE) became available for petroleum coke and coal imports. As a result of this, petcoke imports are revised from 2013, inputs to power and electricity generation are revised from 2019, and other bituminous coal imports and inputs to power are revised from 2019. Information from the Central Bank of Honduras on cement production also led to revised estimates of petcoke industrial consumption in 2013, 2015, 2016 and from 2020 onwards.

In the 2024 edition, plant level information from ENEE resulted in a new biogas electricity production series available from 2007, with the corresponding amounts being removed from the previously existing primary solid biofuels series. Biogas inputs to power are estimated by the IEA Secretariat. The completeness of this series is being monitored and further revisions are possible in the future.

In the 2023 edition, other bituminous coal and petroleum coke stock changes, input to autoproducer electricity plants, and output from autoproducer electricity plants were estimated by the IEA Secretariat for 2021 based on information provided by the Honduras Secretaría de Estado en el Despacho de Energía.

In the 2022 edition, new official data for all energy products and flows from Secretaría de Estado en el Despacho de Energía became available through the sieHONDURAS online platform, for the period 2010-2020. As a result of this, energy statistics and balances of these years have been completely revised.

In the 2021 edition, autoproducer electricity generation from bagasse and fuel oil have been revised for years 2017 and 2018 to reflect new information on cogeneration. As a result of this, 2017 and 2018 inputs to autoproducer plants of fuel oil have been revised, as well as 2017 total electricity generation.

In the 2020 edition, direct communication with the Secretaría de Estado en el Despacho de Energía led to revisions of data since 2005. The revisions made to integrate this information can lead to breaks in time series between 2004 and 2005. Data for coke oven coke were revised to zero and corresponding amounts subsequently re-allocated to petroleum coke.

Hong Kong, China

General notes

Data for Hong Kong, China are available starting in 1971.

Due to lack of available data, the input of biogas to CHP plants may include biogas used for industrial heat.

In the 2024 edition, 2020 and 2021 data has been revised to align IEA data with APERC annual energy data questionnaires. This led to revisions of 2020 and 2021 data for most fuels with the exception of white spirit, lubricants, waxes, bitumen and other non-specified oil products. Revisions are mostly minor, but have larger impacts in natural gas imports and electricity data. For this reason, a structural break can exist in the data between 2019 and 2020. However, data is not fully aligned with APERC data, namely in the natural gas balance, waste and biogas data, as well as gas/diesel oil demand. Hydro data is also included from 2020 onwards (hydropower plant in Tuen Mun coupled with a water treatment plant). Gas/diesel oil use in road and industry in 2020 and 2021 is estimated by the IEA secretariat. 2022 data is partially estimated by the IEA secretariat due to the lack of availability of APERC data for that year in this release. In the 2021 edition, the 2000 to 2019 time series for fuel oil and diesel input to main activity plants was revised to include new information available on the split of the two fuels. Breaks in time series may occur between 1999 and 2000. Prior to 2000, fuel oil input to power plants may include some quantities of diesel.

In the 2021 edition, consumption data for coal were revised over the whole time series to take into account information received from the Hong Kong Electrical and Mechanical Services Department. The revisions result in higher use of coal for electricity production, and very little use of coal in the industry sector.

In the 2021 edition, the naphtha time series was revised to represent the blending to town gas more accurately.

Information on the solid biofuels and waste data was received from the local contacts, which led to the revision of the fuelwood time series to zero as Hong Kong, China, only uses charcoal.

The IEA Secretariat added data for solar PV electricity generation data from auto producers in the 2021 edition, as available from APERC.

In the 2021 edition, stock changes data for 2019 were estimated.
In the 2020 edition, official data for stock changes of coal and oil products became available for 2018. This may lead to breaks in time series between 2017 and 2018.

In the 2020 edition, data for electricity losses and own use breakdown became available from 1996 onwards. For the period 1971-1995, electricity losses include electricity own use.

In the 2016 edition, trade data for various petroleum products were revised based on newly available information. Breaks in time series may occur between 2000 and 2001.

Imports of non-specified oil products used for non-energy purposes are estimated by the IEA Secretariat based on fixed shares of the total imports reported.

IEA Secretariat estimates.
India

General notes

Data for India are available starting in 1971.

India joined the IEA as an Association country in March 2017.

Data are reported by India on a fiscal year basis. Data for 2021 correspond to 1 April 2021 – 31 March 2022. This convention is different from the one used by Government of India, whereby 2021 data would refer to fiscal year 1 April 2020 – 31 March 2021.

Coal

In the 2024 edition new data became available from MOSPI regarding calorific values of coking coal, leading to breaks in time series between 2021 and 2022.

In the 2021 edition several transformation and consumption flows are based on growth of total energy supply for a given product, as official data are not yet available.

In the 2015 edition, significant revisions of the net calorific values of the different types of coal were made for the whole time series, based on official data as well as IEA and other experts’ estimates. As a result, there have been significant changes for the coal data when presented in energy units, as well as in the calculated efficiency of coal fired power generation. Data on the production and consumption of secondary coal products may have also been revised as a result.

The net calorific values of coking coal, sub-bituminous coal and other bituminous coal, were revised again in the 2018 edition to take into account more detailed information on imports and IEA Secretariat experts estimates.

From 2008, due to a notable discrepancy between official coal imports from India and coal exports to India as reported by trade partners, imports of coking coal and non-coking coal are estimated by the IEA Secretariat, based on trade partners’ data. The breakdown of non-coking coal imports between bituminous coal and sub-bituminous coal is estimated from 2008. This could lead to breaks in time series between 2007 and 2008.

Coking coal figures for India do not align with IEA definitions as they include production of non-metallurgical coking coal reported by India.
Due to data limitations, IEA Secretariat estimates are used for some products and flows, including supply and demand of coke oven gas and blast furnace gas. Coke oven coke production is estimated from 2006 based on growth of blast furnace iron production, as official production data do not include production from small private producers.

**Oil**

In the 2023 edition, non-bio jet kerosene consumption by international and domestic aviation bunker were revised from 2018 using the OECD Air Transport CO2 Emissions.

In the 2020 edition, input to autoproducers of electricity were revised from 2008 onwards based on data on their power generation reported by the Central Electricity Authority. In parallel, several final consumption flows were revised to incorporate sales from retailers.

In the 2018 edition, petroleum coke consumption by the non-metallic mineral industries was revised based on information on cement production estimated by the IEA Secretariat based on United States Geological Survey Mineral Industry Report on India. This may lead to breaks in time series as well as differences with previous editions.

In the 2014 edition, information on stock changes of crude oil and oil products, available from the JODI database from April 2011, was added. Breaks in time series may appear in stock changes between 2010 and 2011.

In the 2014 edition, refinery intake was split between crude oil and refinery feedstocks from 1999 based on data available by the Ministry of Petroleum and Natural Gas. The refinery feedstocks reported by the IEA Secretariat correspond to the quantities officially reported as "other inputs" to Reliance Refineries. They do not include additives and refinery feedstocks to other Indian refineries. These missing inputs could reach up to 2.5 million tonnes.

Data for diesel consumption from 2008 are partially based on an official survey on the end use of diesel retail sales. The IEA Secretariat classifies the diesel used in mobile phone towers and non-industry power generators as input to autoproducer electricity generation. A corresponding electricity output is estimated.

No NGL production is officially reported by India. The NGL production estimated by the IEA Secretariat corresponds to the production of oil products from gas separation plants, known in India as “fractionators”. In the IEA methodology, the output of oil products from gas separation plants comes from an input of NGL and
the separation process is shown in the transfer row. Prior to 2005-2006, the split of fractionator output between petroleum products is estimated by the IEA Secretariat.

No breakdown of refinery fuel by products is currently officially available. Refinery gas production is estimated based on expected refinery output for the years where using official data would lead to refinery gains. Due to notable breaks in official data for fuel oil, consumption of fuel oil in international marine bunkers is estimated between 1990 and 2002 based on industry sources and from 2003 onwards based on Ministry of Shipping cargo data; final consumption of fuel oil is estimated from 2004 based on 2003 data and official trends from Ministry of Petroleum and Natural Gas.

Natural gas

In the 2024 edition, new information became available regarding the consumption of natural in the Iron and Steel industries, leading to reallocation some quantities from non-energy uses to energy uses from 2000 to 2022 data.

In the 2020 edition, inputs to main activity producers of electricity were revised from 2010 onwards, based on data reported by the Ministry of Petroleum and Natural Gas. Before 2010 inputs to main activity power plants are estimated by the IEA Secretariat.

In the 2020 edition, use of natural gas in oil refineries was added from 2008 onwards based on data reported by the Ministry of Petroleum and Natural Gas. Before 2008 there is no data reported for this flow.

In the 2020 edition, total final consumption of natural gas was revised from the start of the time series based on data reported by the Ministry of Petroleum and Natural Gas.

Natural gas imports for India from 2008 onwards are based on Indian Customs data, in order to include all LNG importers.

No data are officially available on the sectoral consumption of re-gasified LNG and city gas. The breakdown is estimated by the IEA Secretariat.

Biofuels and waste

In the 2023 edition, consumption of primary sold biofuels by construction sector was reallocated to non-metallic minerals sector for the whole time series based on the fact that it is used to produce bricks.
In the 2023 editions, changes of methodology were implemented to revise the data of off-grid solar PV generation and off-grid biogas production/consumption, thanks to a study by The Energy and Resources Institute (TERI), funded by the Clean Energy Transition Programme; solar PV generation by autoproducer from 2007 year onwards and biogas data from 2005 onwards were revised.

In the 2021 edition, changes of methodology were implemented to revise the data of solid, liquid and gaseous biofuels, thanks to a study by TERI. The scope of data collection for certain products is increased. Full time series were revised for fuelwood, agricultural residues, bagasse, biogases and bioethanol. For solid biofuels, the magnitude of the revision is stronger for the historical data: from 20% in the 1970s to less than 5% in the last five years.

Fuelwood supply is estimated using data from Forest Survey of India, especially looking at fuelwood used for energy usages. Residential consumption is estimated based on households’ reliance of fuelwood for cooking.

Transformation of fuelwood into charcoal is estimated based on an updated efficiency factor expressed in mass unit and is then converted to energy unit.

The demand for charcoal is revised from 2001 onwards, creating a break in time series. The revision takes into account residential consumption of charcoal for cooking, estimated using households’ reliance on charcoal for cooking. Charcoal not consumed by households is allocated to industry consumption. Industry consumption of charcoal is not estimated before 2001.

Vegetal materials and residues’ supply is estimated using both data on agricultural crops production from the Reserve Bank of India and the surplus availability factor published by the Technology Information Forecasting and Assessment Council of India. Agricultural residues consumption by households is estimated based on their reliance of the latter for cooking.

Bagasse production of combined heat and power is estimated by recouping two sources of information. Bagasse production is estimated based on sugarcane production considering both sugar processing units and jaggery units. As electricity and heat are a by-products of these facilities, they are reported under the category auto-producer CHP plants. Electricity generation is estimated using CEA data and recouped with MNRE data on installed on-grid and off-grid capacity. From 2016 onwards, surplus and non-surplus electricity generated are estimated. Up to 2015, non-surplus electricity is estimated to ensure continuity of the time series. Electricity used to power the plants and electricity used for sugar processing are estimated in the balance by considering an average bagasse-
based processing unit. The heat produced from bagasse and directly used by the sugar industry is tracked by its bagasse input, measured as the residual bagasse not used for electricity generation.

Biogas production scope is widened in the 2021 edition, covering not only the biogas used in power production, but also estimating direct final consumption. Anaerobic and thermal technologies to produce biogas are taken into account, using data published in the Annual Report of the Ministry of New and Renewables Energy. Data includes the family scale biogas program, the community scale biogas program, the bio-CNG and the biogas produced in industry. Thermal gasification processes are also covered, based on installed capacity data published by MNRE and IEA Secretariat estimation.

In the 2021 edition, bioethanol production figures are based on official data published by the Ministry of Petroleum and Natural Gas. Demand figures are based on United States Department of Agriculture estimates for the calendar year.

Biodiesel demand and supply are based on the data published by the United States Department of Agriculture estimates for the calendar year.

Electricity and heat

In the 2023 edition, electricity generation from diesel have been estimated from 2010 year onwards to have a reasonable power efficiency.

Data for total electricity generation include estimates for electricity generation from diesel by non-industrial autoproducers as well as off-grid electricity generation from renewable energy. 2020 data on the electricity consumption by industrial sub-sector are estimated by the IEA Secretariat.

Only information on total on-grid generation from renewables is officially available. The breakdown between sources was estimated by the IEA Secretariat from 2007 using official data on capacities from MNRE. Total off-grid generation and split by sources are estimated based on capacities from 2007 onward.

Solar power generation data reported by CEA include both solar photovoltaic (PV) generation and concentrated solar power generation. It is currently reported in the solar PV commodity balance. The IEA Secretariat solar thermal data only include what derives from heat systems.

Output of biomass power generation and bagasse co-generation is reported altogether as output of autoproducer electricity plants. Up to 2015 data, it only includes the surplus power generation sold to the grid. From 2016 onwards,
capacity data reported by MNRE include non surplus capacity; the output of electricity estimated by the IEA Secretariat therefore corresponds to the total output of electricity. Breaks in time series occur between 2015 and 2016.

Estimates of solar thermal output up to 2012 may include systems that were out of operation. For this reason, a break in time series might occur between 2012 and 2013.

Indonesia

General notes

Data for Indonesia are available starting in 1971.

Indonesia joined the IEA as an Association country in November 2015.

The production and allocation of coal among the various coal types and products are estimated by the IEA Secretariat due to data collection limitations.

The IEA Secretariat estimates coking coal production for the period from 2014 onwards. Breaks in time series may appear between 2013 and 2014. From 2011 onwards, coal exports data from BPS are used. This results in breaks in time series for 2010-2011.

Indonesia has started operating blast furnaces again in 2016. However, no information is available to the IEA Secretariat to accurately report these transformation processes; the coal used in blast furnaces is therefore included in the iron and steel sector.

In the 2024 edition, residential consumption of solid biofuels was revised downwards. This adjustment was made based on official statistics reported in the HEESI.

In 2022, coal consumption experienced a notable increase, particularly within the iron and steel sector. This surge can be partly attributed to heightened activity in nickel smelters during the specified period.

In the 2022 edition, data reported for coal consumption in non-metallic minerals industry might also include coal consumed in the textile and fertilizers sectors. This may create breaks in time series.

In the 2021 edition, new information on the use of biodiesel was available. This allowed the Secretariat to estimate the part blended with diesel and allocate it to biodiesel for 2019. In the time series up to 2018 included, some biodiesel consumption data could still be included under gas/diesel. This leads to breaks in time series between 2018 and 2019.

In the 2021 edition, the ministry of Energy and Mineral Resources was able to retrieve information to split the electricity generation from biofuels and waste into the different sources. This leads to breaks in time series between 2018 and 2019.
In the 2020 edition, new information on coal sales has led to revisions of the coal consumption in industry, as well as to coal production, for both other bituminous coal and sub-bituminous coal. This leads to breaks in time series between 1999 and 2000 as well as 2010 and 2011.

In the 2020 edition, the IEA Secretariat integrated new information on the classification of power plants for the year 2018. This might lead to breaks in time series between 2017 and 2018.

Further, the Ministry of Energy and Mineral Resources has, for 2018 data and for the first time, provided the Secretariat with estimates for Indonesia’s off-grid electricity production. This information has been added to the 2018 electricity data and leads to breaks in time series, foremost but not exclusively for solid biofuels data.

In the 2019 edition, the IEA Secretariat came across new information regarding the use of coal in Indonesia’s industry sector. First estimates of this use may lead to breaks in time series between 2015 and 2016, as well as between 2016 and 2017.

In the 2018 edition, the Ministry of Energy and Mineral Resources allocated power generation from solid biofuels and waste to waste power plants according to new information received from PLN. This leads to a break in time series between 2016 and 2017.

The data on electricity generation from other vegetal materials and residues includes some electricity generation from waste until the year 2016.

In the 2015 edition, data reported for coal consumption in pulp and paper industry might also include coal consumed in the textile and fertilizers sectors. This may create breaks in time series.

Electricity consumption for the agricultural sector is estimated by the IEA Secretariat from 2000 onwards. This may lead to breaks in time series between 1999 and 2000.

Kenya

General notes

Data for Kenya are available starting in 1971.

Kenya is one of the ten countries that benefit from EU Support to IEA Data for Affordable and Sustainable Energy System for Sub-Saharan Africa.

Solar photovoltaic data comes from the International Renewable Energy Agency (IRENA) estimations of the off-grid generation up to 2018.

In the 2024 edition, data for other bituminous coal and bitumen were revised back to 2006 and 2010, respectively. These revisions were made to align with time series data published in the Kenya National Bureau of Statistics Statistical Abstract.

In the 2024 edition, data for bio-gasoline (bioethanol) were added based on publications by the Kenya Energy and Petroleum Regulatory Authority and Ministry of Energy.

In the 2023 edition, IEA Secretariat estimates of charcoal and primary solid biofuel production and consumption were revised for the entire time series.

In the 2022 edition, electricity data were revised from 2003 to 2019 to be reported on a calendar year basis. In previous editions, electricity data were reported on a fiscal year basis, beginning on 1 July and ending on 30 June of the subsequent year.

In the 2022 edition, oil product data were revised to more accurately reflect the final consumption by sector reported by the Kenya National Bureau of Statistics.

In the 2021 edition, new information became available on the detailed generation of electricity from oil products. Generation per product is now available from 2016 onwards.

In the 2021 edition, new information became available on the food and tobacco industry activity, leading to revisions of the estimations for energy consumption in the sector from 1996 onward.

In the 2020 edition, refinery data have been revised from 2014 onwards, as the national refinery have stopped its activity in 2013.
In the 2020 edition, new data regarding primary and secondary biofuels production and consumption became available, leading to breaks in time series between 2017 and 2018.

In the 2014 edition, fuelwood and other vegetal matters and residues are estimated based on 2000 data. Charcoal data are derived from the wood input to charcoal production with assumed efficiency of 33%; bagasse production and input to power plants is back-estimated from data on Mumias cogeneration.

In 2014, the Olkaria geothermal plant came online, significantly increasing the country's geothermal electricity production capacity. Breaks in time series can be observed between 2013 and 2014 in electricity output from geothermal energy.

IEA Secretariat estimates.
Kosovo

General notes

Data for Kosovo are available starting in 2000. Between 1990 and 1999, data for Kosovo are included in Serbia. Prior to 1990, they are included in Former Yugoslavia.

In 2021, imported and exported electricity present a significant increase with respect to previous years, as Kosovo was used more as transit.

In 2011, electricity transit trade data became available. As a result, a break in time series occurs between 2010 and 2011.

In 2011, a desulphurization unit operated in Kosovo for a few months only. As a result, breaks in time series occur in 2011 for transfer and refinery input of refinery feedstocks as well as transfer and production of kerosene, gas/diesel oil and fuel oil.

A break in time series between 2015 and 2016 may be observed in biofuels and waste due to a survey conducted on household consumption.

Malta

General notes

Data for Malta are available starting in 1971.

In the 2022 edition, gross electricity generation from Solar PV autoproducers and several data points in electricity final consumption were revised for the years 2018 and 2019, using new data provided by the National Statistics Office.

In the 2020 edition, biodiesel use was reclassified by the Central Office of Statistics as transformation from 2016 onwards. This may lead to breaks in time series of transport, industry and other sector final consumption between 2015 and 2016.

In the 2020 edition, for several oil products, the final consumption in transport, industry and commerce, services and other sectors was also revised, for the period 2013-2016.

In 2017, Malta imported LNG for the first time. It is used in power generation engines that have been upgraded to operate on natural gas, from heavy fuel oil previously. 2015 and 2016 data reflects this transition with high imports of electricity via the interconnector with Italy.

In the 2019 edition, oil products consumption data have been revised following the results of a fuel survey conducted by the country in 2018.

In 2017, Malta carried out a household energy survey which led to revisions of the solar thermal data series for 2010-2016. This may lead to breaks in time series between 2009 and 2010.

In 2011, a new power generation station fuelled by biogas became operational in Malta. This may lead to breaks in time series for some products and flows.

IEA Secretariat estimates.
Mauritius

General notes

Data for Mauritius are available starting in 1971.

In the 2021 edition, minor revisions were made to LPG imports (2017-2018), LPG exports (2016), and stock changes of LPG, motor gasoline, gas/diesel oil, kerosene, and fuel oil (2010-2018). Revisions were also made to domestic navigation for motor gasoline, gas/diesel oil, and fuel oil (2012-2018), and to international aviation bunkers, stock changes and domestic aviation for kerosene type jet fuel (2016-2018).

Moldova

General notes

Data for Moldova are available starting in 1990. Prior to that, they are included in Former Soviet Union.

Moldova is one of the 11 EU4Energy focus countries.

Official figures on natural gas imports, natural gas inputs to power plants, electricity production, foreign trade and consumption are modified by the IEA Secretariat to include estimates for supply and demand for the districts from the left side of the river Nistru and municipality Bender. Other energy production or consumption from these districts is not included in the Moldovan data. This may lead to breaks in the time series for some products.

In the 2024 edition, consumption of other bituminous coal in non-metallic industry for 2022 has been partially replaced by other fuels, like anthracite and petroleum coke, but it also reflects the drop of cement production in the country. Instead, the increase in residential use is due to the surge in price of other energy products.

In the 2024 edition, trade of motor gasoline from Romania to Ukraine is recorded in the database, in accordance with Moldovan national regulations – only goods remaining on the national territory for less than 8 calendar days can be considered in transit.

In the 2023 edition, data for capacity have been added. Data are obtained by modifying official figures to include estimates from the districts from the left side of the river Nistru and municipality Bender.

In the 2022 edition, 2019 and 2020 natural gas imports data was estimated due to data confidentiality.

Due to the inclusion of estimated data in the Moldova energy balance, indicators for per capita energy consumption or energy intensity may appear inconsistent with expected trends.

The National Bureau of Statistics has revised time series when possible to align with International Recommendations for Energy Statistics. As a consequence, breaks in time series may occur in 1993 for heat, in 2012 for aviation bunkers and in 2005 for other products. More survey data on solid biofuels, including wood, animal waste and other plant residues are available since 2010. As a consequence, breaks in time series may occur in 2010 for primary solid biofuels.

IEA Secretariat estimates.
Montenegro

General notes

Data for Montenegro are available starting in 2005. Between 1990 and 2004, they are included in Serbia. Prior to 1990, they are included in Former Yugoslavia.

In the 2023 edition, capacity data for solar photovoltaic for 2020 was revised due to new information becoming available.

In the 2022 edition, 2020 electricity trade data include transit of electricity, which was not considered for previous years. This led to breaks in the time series of imports and exports of electricity between 2019 and 2020.

In the 2021 edition, lignite calorific values from 2016 to 2018 were revised due to new information becoming available.

In the 2020 edition, the whole time series of solid biofuel transformation were revised due to new information becoming available.

Charcoal imports data might include minor quantities of charcoal produced domestically until the year 2017.

Breaks in time series appearing in solid biofuels between 2010 and 2011 can be explained by a new survey carried out by Montenegro in 2013.

A survey on energy consumption in industry was conducted by Montenegro in 2014. Breaks in time series may therefore occur between 2004 and 2005.

Sources

Sources 2005 to 2022:
Direct communication with the Statistical Office of Montenegro (MONSTAT), Podgorica.

Joint IEA/Eurostat/UNECE annual energy questionnaires.

Sources 2021:
Morocco

General notes

Data for Morocco are available starting in 1971.

Morocco joined the IEA as an Association country in November 2016. Morocco started filling the five Joint IEA/Eurostat/UNECE questionnaires for the year 2015. This may lead to breaks in time series between 2014 and 2015.

Crude oil consumption in the oil and gas sector corresponds to condensates.

In the 2024 edition, revisions were made for gross and net electricity production from diesel, fuel oil and petcoke (from 1990 to 2012). This may lead to breaks in time series.

In the 2023 edition, revisions were made for rail transport (2021), gross and net electricity production and electricity consumption (from 2004 to 2012). This may lead to breaks in time series.

In the 2022 edition, revisions were made to disaggregate autoproducer electricity production from main activity electricity production for wind (2013-2019) and fuel oil electricity only plants (2019). Breaks in time series may occur.

In the 2019 edition, revisions in solar thermal electricity production were made for 2015 and 2016. This may lead to breaks in time series.

In the 2018 edition, revisions in biofuels were made for the period 2004-2014. This may lead to breaks in time series between 2003 and 2004.

Data for autoproducer electricity are based on an old survey. Revisions are expected in the next cycles.

The Samir-Mohammedia refinery expansion was completed in 2009, accommodating new feedstocks and additives. This may lead to breaks in time series between 2009 and 2010.

In August 2015, refinery activity stopped, causing significant decreases in refined oil products production and breaks in time series between 2014, 2015, and 2016.

IEA Secretariat estimates.
Republic of North Macedonia

General notes

Data for North Macedonia are available starting in 1990. Prior to that, they are included in Former Yugoslavia.

North Macedonia changed the methodology for reporting autoproducer heat consumption for own use in 2010, which can lead to breaks in time series between 2009 and 2010.

The refinery OKTA in North Macedonia was shut down in 2014. This may lead to breaks in time series between 2013 and 2014.

The State Statistical Office revised the energy balances from 2005 to 2014 in accordance with the survey conducted in 2014 on household energy consumption.

In the 2024 edition, the North Macedonian administration informed the IEA Secretariat that consumption of aviation gasoline in non-energy use transport will be reallocated to energy-use. Revisions are expected in the next publication.

In the 2023 edition, electricity imports and exports were revised from 2019 to 2020 to include transit trade. Electricity trade prior to 2019 represents net trade values and does not include the amount in transit, leading to breaks in the time series between 2018 and 2019.

2022 preliminary supply data for Renewables and Waste is estimated by the IEA secretariat to be equal to 2021.

Sources

Sources 1990 to 2022:

Direct communication with the State Statistical Office of North Macedonia, Department for Environment, Energy and Transport, Skopje.

Joint IEA/Eurostat/UNECE annual energy questionnaires.

IEA Secretariat estimates.
Paraguay

General notes

Data for Paraguay are available starting in 1971.

The Itaipu hydroelectric plant, operating since 1984 and located on the Paraná River (which forms the border of Brazil and Paraguay) was formed as a joint venture between Eletrobrás and the Paraguayan government.

Paraguay is ongoing harmonization efforts with IRES. This process is not yet concluded and has so far applied to 2021 and 2022 data only. Revisions to historical data are possible in the future. In the 2024 edition, as a result of this harmonisation, 2021 and 2022 data for different fuels include a breakdown of industrial consumption, information on aviation and marine bunkers, and new information on biodiesel and electricity generation from bagasse, fuel wood and other biomass and residues. This leads to a structural break in data between 2020 and 2021. However, information on gas/diesel oil use in marine bunkers and in domestic navigation is also available for 2020. The new biodiesel time series is available from 2007 onwards.

In the 2021 edition, revisions to 2018 kerosene and jet kerosene data have been made. In addition, 2006-2009 data has been revised to reflect revisions on national energy balances. These have led to changes to charcoal, gasoline, diesel, fuel oil and ethanol flows. The 2021 edition also revises electricity data to include small imports of electricity in 2005 and 2006.

In the 2020 edition, 2015 data on coal and fuel wood were revised, as well as 2013 data on electricity demand and 2012 data on diesel oil, due to revision of national energy balances. Data was revised for lubricants from 2003, bitumen from 1994 and petroleum coke between 2013 and 2015 due to new information from Banco Central del Paraguay. This may lead to break in time series.

Paraguay’s cement industry underwent a fuel switch from fuel oil to petroleum coke. The consequent increase in petroleum coke imports and use is reflected in the data. In the 2020 edition, imports data for 2014 and 2015 were revised based on new trade information.

In the 2020 edition, new information on the industrial consumption of solid fuels led to a reallocation of industrial consumption of charcoal and anthracite to the iron and steel industry. Paraguay is continuing to developing its statistical system further and additional data and sectoral disaggregation is likely to be available in
the future and taken into account in future editions. At present, there is no available information on the capacity and generation of solar and wind power.

In the 2019 edition, wood data was revised for 2016 due to a revision of the wood density used by the source. This led to a break in time series between 2015 and 2016.

In the 2019 edition, new information became available on the split between international and domestic use of jet kerosene from 2005 onwards. The consequent data revision may lead to break in time series between 2004 and 2005.

In 2015, Paraguay surveyed the charcoal production plants. The results allowed to correct the efficiency of the process down to 49%. This change is implemented in the data from 2015 onwards and leads to a break in the time series of wood input to charcoal production plants.

From 2006 onwards, there has been no output of oil products, due to refinery closure.

Romania

General notes

Data for Romania are available starting in 1971.

Romania’s methodology for estimating indigenous production of geothermal energy differs from the one that IEA has adopted. Therefore, data comparisons between Romania and other countries might be misleading.

Data on quantities of coke oven coke used in blast furnaces do not correspond to the official submission of the national administration, as they have been estimated by the IEA Secretariat to ensure a carbon balance in the blast furnace transformation.

In the 2021 edition, net calorific values (NCVs) reported by Romania were used to convert physical data to energy units. In previous years, IEA standard NCVs were used. As a result, the time series of primary and secondary oil products in energy units were revised for varying periods between 1990 and 2018. Furthermore, the NCVs for coal products have been aligned to the reported ones, leading to revisions especially for the coal data in energy units used in power plants.

The break in time series for geothermal consumption in the Residential sector in 2020 is due to reporting issues in Romania. Geothermal consumption in 2020 is expected to be revised in the 2024 edition.

Heat production from Geothermal Autoproducer heat plants for 2018 and 2020 are missing in the 2023 edition. Heat production values are expected to be revised in the 2024 edition.

Disaggregated Heat production for preliminary 2022 data is estimated by the IEA secretariat except of Natural Gas and Residual Fuel Oil.

IEA Secretariat estimates.
Senegal

General notes

Data for Senegal are available starting in 1971.

Senegal is one of the ten countries that benefit from EU Support to IEA Data for Affordable and Sustainable Energy System for Sub-Saharan Africa.

In the 2021 edition, previously reported hydroelectricity production was revised as imports from 2009 onwards, as the dam is not located within the borders of the country.

In addition, in the 2021 edition, the electricity output was split per oil product from 2017 onwards thanks to new information available. Thanks to improvements in the data collection system, the final consumption of electricity is monitored more accurately in 2019. This may lead in breaks in time series between 2018 and 2019.

Finally, in the 2021 edition, quantities of diesel used to start ignite the power plants were reported for the first time, related to the 2019 diesel consumption.

In the 2020 edition, data for 2017 have been revised based on new data received from the Ministère de l’Energie et des Mines.

In the 2018 edition, data for 2014 and 2015 are revised based on information received from the Ministère de l’Energie et des Mines.

In the 2014 edition, the time series for solid biofuels were revised from 2009 onwards based on newly available information. Breaks in time series may occur between 2008 and 2009.

Serbia

General notes

Data for Serbia are available starting in 1990. Prior to that, they are included in Former Yugoslavia.

Heat production from Autoproducers includes all heat produced.

In the 2024 edition, primary solid biofuels consumption in main activity producer CHP and, consequently, its heat production for the years from 2019 to 2021 were reallocated to main activity producer heat due to new available information.

In the 2022 edition, the Lignite input to Heat Autoproducers and the Lignite own use in BKB/peat briquettes plants time series have been revised from 2014 to 2019, due to new information provided by the Ministry of Mining and Energy and the Statistical Office of the Republic of Serbia.

In the 2022 edition, the large increase observed in Primary solid biofuels final consumption in the residential sector for year 2020 is due to a specific survey carried out under the authority of the Ministry of Mining and Energy, concerning only year 2020. This creates a break in-series with historic data.

In the 2021 edition, the time series for non-bio diesel consumption from 2016, lignite input into power plants from 2014, and inputs into blast furnaces from 2017 have been revised due to new information and improved methodologies.

IEA Secretariat estimates.
Singapore

General notes

Data for Singapore are available starting in 1971.

Singapore joined the IEA as an Association country in October 2016.

At the time of publication of the 2023 edition, refinery input and output figures for 2021 were not available and they have therefore been estimated by IEA Secretariat. These values may differ significantly from actual figures published later in Singapore’s official sources. The 2020 refinery input and output became available, leading to revisions of the numbers published in the 2022 edition.

In the 2022 edition, the 2006-2019 electricity road consumption data were revised to take into account estimated Electric Vehicle (EV) consumption under transport sector.

In the 2021 edition, the 2008-2019 exports data for aviation gasoline were revised as new information became available.

The IEA Secretariat, the Energy Market Authority (EMA) and the National Climate Change Secretariat (NCCS) have worked closely together on improving data quality for Singapore. Therefore, breaks in time series between 2008 and 2009 and differences in trends when compared to previous publications may occur for some products.

From 2009, Singapore publishes splits of refinery output between light, middle and heavy distillates and residuum only. Further breakdown between products is estimated by the IEA Secretariat. Singapore aggregates petrochemical and refinery consumption. The split between refining and petrochemical consumption is estimated by the IEA Secretariat.

Refinery input is broken down between crude oil and feedstocks. Splits of feedstock by product are not provided by Singapore. By default, IEA estimates that feedstocks come from naphtha as a result of residual calculation plus gas/diesel and fuel oil in equal proportions.

Other data remain aggregated due to lack of data availability. Electricity consumption in the industry sector from 2005 includes electricity consumption by refineries. Electricity consumption in transport includes all electricity consumption at airport terminals. Municipal waste production and consumption may include biogas.
Refinery gas production and consumption may include syngas produced by the petrochemical sector.

Due to Singapore’s large trade volume in comparison to its final consumption, slight misalignment of trade figures can have a significant impact on the energy balance of Singapore. The IEA Secretariat has adjusted total imports of gas/diesel from 2009 onwards to match demand.

A coal-fired power plant started operations in 2013. This might lead to breaks in time series between 2012 and 2013.

IEA Secretariat estimates.
South Africa

General notes

Data for South Africa are available starting in 1971.

South Africa became an IEA Association country in November 2018.

Data may be revised from Y-2 to Y to reflect the Y-2 and Y-1 energy balances published by the Department of Mineral Resources and Energy as they become available.

Coal

Outputs from gas-to-liquids and coal-to-liquids plants are presented in the “Transfers” flow.

Coking coal, coke oven coke, coke oven gas and blast furnace gas production and consumption are estimated using reported crude steel production figures.

For the 2019 edition, the estimation methodology was changed for gas work gas, which may lead to break in time series between 2009 and 2010. The IEA Secretariat uses the industrial activity data reported by the World Steel Association to estimate the consumption of the industry sector.

In the 2017 edition, new information became available which allowed the separation of non-energy use of coal in Coal to Liquids (CTL) plants from the coal used for energy purposes in these same plants. Non-energy conversion efficiencies for CTL plants in South Africa are assumed to be 60% in physical units. Due to specific calorific values used for this specific process, the efficiency is 73% in our energy balance format. This methodology may lead to breaks in time series between 2010 and 2011 for these products and flows.

In the 2013 edition, breaks in time series may occur for anthracite and coking coal between 2009 and 2010 as new information became available. Prior to 2010, coking coal data may include anthracite.

Oil

In the 2023 edition, the split of oil consumption between domestic and international aviation was revised from 2013 onwards based on new information.

In 2020 and 2021, oil production declined due to shutdowns at several refineries.
In the 2021 edition, the 2016-2019 inputs to refineries and outputs of refined oil products for were revised to avoid refinery gains in energy terms. This may result in high statistical difference for crude oil data.

In the 2019 edition, new information became available that led to changes in the split of kerosene type jet fuel consumption in domestic aviation and international bunker. Breaks in time series may occur between 2008 and 2009.

New information became available in 2015 on refinery output of lubricants. Data have been revised from 1998. This may lead to breaks in time series between 1997 and 1998. Reported quantities of synthetic fuels output may not include quantities from PetroSA.

**Natural gas**

In 2021, natural gas production declined as natural gas field feeding the Mossel Bay GTL plant neared end-of-life.

In the 2014 edition, new information became available on consumption of natural gas in industrial sectors. Breaks in time series may occur between 2009 and 2010.

**Biofuels and waste**

In the 2024 edition, the time series of charcoal and primary solid biofuels were revised starting in 2000 using estimates from IEA Secretariat. Production, transformation, and consumption estimates were revised accordingly. Breaks in time series may occur between 1999 and 2000.

In the 2022 edition, the estimation methodology of bagasse and other vegetal materials and residues (primary solid biofuels) was changed to utilize data from the Department of Mineral Resources and Energy, FAO, and IRENA. Breaks in time series may occur between 1998 and 1999.

**Electricity and Heat**

Nuclear and Hydro electricity generation data are reported on a fiscal year basis, beginning on the 1 April Y and ending on the 31 March Y+1.

In the 2024 edition, electricity generation from liquid fossil fuels (OCGT) was revised to align it with ESKOM reporting.

IEA Secretariat estimates.
Thailand

General notes

Data for Thailand are available starting in 1971.

Thailand joined the IEA as an Association country in November 2015.

Data for lubricants, refinery gas and non-specified oil products are not published by the Ministry of Energy and are estimated by the IEA Secretariat. Up to 2012 data, IEA Secretariat also estimated naphtha.

Data for production, own use and non-energy use of natural gas may include propane, butane and ethane produced in gas separation plants.

Stock changes may include statistical difference for certain products.

From 2013 onwards data for kerosene production and stock change may include quantities of kerosene used for jet fuel and base diesel production.

For the first time, in 2022 data the Thailand energy balance reports disaggregated figures for stock change and statistical difference. Breaks in time series of these flows may occur between 2021 and 2022.

In the 2024 edition, final consumption of natural gas in some industry sectors (iron and steel, non-metallic minerals, machinery and non-specified industry) and non-energy use in the chemical and petrochemical sector have been estimated to avoid unexplained breaks in their time series.

In the 2024 edition, the IEA Secretariat estimated production of diesel/gasoil for 2022 based on official data from the Petroleum Institute of Thailand.

In the 2024 edition, the IEA Secretariat revised the consumption of gas/diesel oil and fuel oil in main activity producer electricity consumption and the corresponding electricity output from 2020 and 2019, respectively, to better reflect official data from the Electricity Generation Authority of Thailand and the Energy Policy & Planning Office of the Ministry of Energy. Furthermore, for the same years and for both products, the IEA Secretariat revised the estimations of stock change and, only for diesel, of non-specified industry consumption.

In the 2024 edition, the split between domestic and international aviation consumption of jet kerosene has been revised from 2014 onwards due to new available information.
In the 2023 edition, non-energy use of kerosene from 2016 onwards was reported due to new available information.

In the 2023 edition, coke oven coke and blast furnace gas were revised to zero by the IEA Secretariat to reflect the absence of blast furnaces in the country.

In the 2022 edition, the IEA Secretariat revised the methodology for reporting LPG output from the condensate splitter and the corresponding field condensates input. As a result, crude oil input to petrochemical plants between 2013 and 2019 has been deleted, while input to oil refineries has been revised. This also led to the removal of the time series on refinery feedstock production from other sources – oil products and transfers between 1996 and 2019, which also affected naphtha and LPG production figures between 1996 and 2019 and 2008 and 2019, respectively.

In the 2022 edition, NGL non-energy use in 2013 and 2014 was revised due to new available information.

In the 2021 edition, natural gas consumption in the industry sector was revised to reflect official data more accurately.

In the 2021 electricity generation data for hydropower, fuel oil and other bituminous coal plants were revised to take into account new information available on the split between main activity and autoproducer plants.

Naphtha production data from 2018 onwards, motor gasoline from 2019 and gas/diesel oil for 2018 were estimated by the IEA Secretariat to avoid refinery gains.

In the 2021 edition in an effort to report the consumption of aviation fuels more accurately across the time series, the IEA Secretariat estimated the split between international and domestic aviation consumption prior to 2006.

In the 2020 edition, motor gasoline, other kerosene and fuel oil total final consumption as well as gas/diesel oil used in transformation processes were revised to reflect official data more accurately.

In the 2020 edition, natural gas flows between 2014 and 2017 were revised as new information on its consumption in the industry sector became available. Electricity consumption in the rail sector between 2014 and 2017 was revised as new information became available. Primary solid biofuel flows between 1989 and 1994 were revised as new information became available.
In the 2014 edition, information became available for the consumption of anthracite and lignite coal in industry. Breaks in time series may occur between 2011 and 2012.

Tunisia

General notes

Data for Tunisia are available starting in 1971.

A significant increase in electricity imports and decrease in electricity export is reported for 2021. This is due to the decrease of gas purchase from Algeria, which reduced the electricity production from gas in Tunisia.

In the last years, T&D losses are quite high, reaching a maximum in 2021. As tariffs rise and purchasing power decreases, customers are turning more and more to practices of diverting electricity, leading to an increase in non-technical losses.

In the 2024 edition, Solar PV generation data were revised downwards. This adjustment was prompted by the discovery of abnormally high production estimates for Solar photovoltaic (autoproducers) in relation to the installed capacity.

In the 2021 edition, net calorific values (NCVs) reported by Tunisia were used to convert physical data to energy units. In previous years, IEA standard NCVs were used. As a result, the time series of primary and secondary oil products in energy units were revised for varying periods between 1990 and 2018.

In the 2015 edition, new information for lubricants and bitumen became available. This may lead to breaks in the time series between 2009 and 2010.

A significant increase in crude oil production was reported for 2007 due to the start-up of several new development wells and the beginning of production of the Oudna field.

A shutdown of the Bizerte refinery occurred between March 2010 and June 2011, resulting in breaks in time series for crude oil and oil products for the years 2009 to 2011.

In the 2009 edition, new data on charcoal production became available. A break in time series for wood inputs and charcoal outputs can be observed between 2008 and 2009.

Revisions in heat data between 2013 and 2014 from the 2017 edition are based on a survey of autoproducers.

IEA Secretariat estimates.
Ukraine

General notes

Data for Ukraine are available starting in 1990. Prior to that, they are included in Former Soviet Union.

Ukraine is one of the 11 EU4Energy focus countries.

Ukraine has been under martial law since Russia’s invasion in February 2022. As a result, the State Statistics Service of Ukraine is no longer able to submit detailed energy statistics to the IEA via the Annual Questionnaires. Therefore, data for 2021 and 2022 have been estimated by the IEA Secretariat using a variety of sources. In particular, national activity information on industrial and services sectors has been used to estimate demand. However, due to the difficulty associated with estimating data in a wartime environment, several flows have been marked as “not available” and/or reported at an aggregated level. This leads to breaks for some timeseries.

Due to limited information being available to the State Statistics Service of Ukraine from part of the Donetsk and Luhansk regions of Ukraine and from the Autonomous Republic of Crimea, breaks in the time series occur after 2013 for coal products and in 2016, for diesel energy industry own use.

The IEA Secretariat and the State Statistics Service of Ukraine have worked closely on the revision of historical data. Therefore, breaks in time series may occur between 2006 and 2007.

From 2007 onwards the transparency of data may be reduced because of confidentiality issues. For instance: peat includes lignite and patent fuel; other kerosene includes aviation fuels (aviation gasoline, gasoline-type jet fuel and kerosene-type jet fuel) for the period 2007-2015; other products include petroleum coke; since 2016 aviation fuels and kerosene are included in other products; since 2017 bituminous coal includes anthracite.

Coal

IEA statistics refer to coal after washing and screening for the removal of inorganic matter. Official Ukrainian coal statistics refer to unwashed and unscreened coal prior to 1995.

The decline in coal production observed since 2013 is the reflection of lack of data availability in these regions, not of an actual decrease in coal production.
In the 2022 edition and for the year 2020, coking coal production has been reclassified as other bituminous coal production due to the lower quality of the extracted coal. This creates a break in the time series of indigenous production between 2019 and 2020 for both coal products.

Anthracite supply and demand data since 2017 are included in other bituminous coal due to confidentiality issues.

Bituminous coal from other sources refers to coal mined in informal sector.

Due to a plant closure in 2008, a stock of lignite/peat became available, without details about its consumption. This may lead to breaks in time series and high statistical difference for 2008.

Since 2013, quantities of other bituminous coal reported under patent fuel transformation are used to make briquettes from dust and due to confidentiality and calorific value of this output, it is reported in peat products and not in patent fuel production.

Oil

From the 2020 edition, the Statistics Service of Ukraine is encountering confidentiality issues that lead to lack of refinery output data availability. Since 2018 data, the resulting large refinery losses reflect the missing output data, notably motor gasoline and gas/diesel oil. Part of the production of Ukraine’s refinery is included with “other non-specified oil products”, for example all motor gasoline produced in 2018, and part of this production in 2019. Because of this, from the 2022 edition the IEA Secretariat decided to report motor gasoline and gas/diesel oil production from 2018 onwards as confidential.

Large statistical differences exist for some oil products such as transport fuels and LPG. These are due to identified reporting issues in Ukraine. The State Statistics Service of Ukraine continues to work with data providers to solve these issues.

Due to lack of disaggregated data, aviation fuels are included with “Other non-specified oil products”.

In the 2017 edition, refinery inputs have been estimated for 2015 by the IEA Secretariat based on supply to correct the disbalance between inputs and outputs; discrepancies may appear in the 2015 refinery balance.

In the 2016 edition, refinery gas is reported in the transformation sector. A break in time series and statistical difference appear as more information on the supply side remains unavailable.
Quantities of other hydrocarbons reported correspond to petroleum coke produced from coal tar. This information is not available for 2016.

**Natural gas**

The data for the stock draw and statistical difference of natural gas in 2010 are a consequence of the accounting method chosen by the Ukrainian administration to reflect the ruling of the Stockholm Arbitration Tribunal of March 30, 2010.

Gas stocks include stocks supplied to the Autonomous republic of Crimea.

Due to the new annual survey form, there was reclassification between main activity producers and autoproducers in 2016.

**Biofuels and waste**

Charcoal production has included pyrolysis and calculated amounts of traditional production since 2008.

**Electricity and heat**

Statistical difference for electricity includes electricity supplied to the Autonomous Republic of Crimea and the Donetsk and Luhansk regions of Ukraine.

In the 2016 edition, power plants have been reclassified due to the implementation of more detailed survey forms.

IEA Secretariat estimates.
Uzbekistan

General notes

Data for Uzbekistan are available starting in 1990. Prior to that, they are included in Former Soviet Union.

Uzbekistan is one of the 11 EU4Energy focus countries.

In the 2024 edition, revisions to calorific values of crude oil, LPG, motor gasoline, gas/diesel oil, fuel oil and pet coke took place from 2006 onwards to better reflect the characteristics of local crude as well as national data on oil products. In the 2024 edition, new information from the State Committee of the Republic of Uzbekistan on Statistics led to a new series of electricity generation from solar and wind, as well as revisions to other bituminous coal inputs to power plants, total electricity generation and the thermal split of power generation from 2012 onwards. A structural break in electricity generation from coal exists between 2018 and 2019, due to better availability of data from 2019 onwards. 2021 crude oil imports and 2022 production of other hydrocarbons (gas-to-liquids) are estimated by the IEA secretariat. In the 2024 edition, data on oil products has been revised from 2006 onwards. Oil product information between 2018 and 2020 has been partially revised using new detailed information from the State Committee of the Republic of Uzbekistan on Statistics on products such as paraffin waxes, lubricants and bitumen. As a result of this, some data has been re-estimated by the IEA secretariat between 2014 and 2017. Natural gas production data for 2018 and 2019 has been revised, as well as energy industry own use from 2018 onwards. From 2021 onwards, imports and exports of some oil products, e.g. other kerosene, may include fuel in transit.

In the 2023 edition, data on the split between domestic and international aviation were revised from 2013 onwards based on new information.

In the 2022 edition, the State Committee of the Republic of Uzbekistan on Statistics submitted data on electricity, coal, natural gas and oil through the joint IEA/Eurostat/UNECE annual energy questionnaires with improved disaggregation of data. This led to breaks in time series between 2019 and 2020.

In the 2021 edition, the State Committee of the Republic of Uzbekistan on Statistics submitted data on electricity, coal, natural gas and oil through the joint IEA/Eurostat/UNECE annual energy questionnaires, with revisions for the historical data of non-bio jet kerosene, diesel and bitumen. Revisions may also affect diesel and gasoline between 2013 and 2016.
In the 2021 edition, new data available led to the addition of heat transmission and distribution losses from 1990 onwards.

In the 2020 edition, the State Committee of the Republic of Uzbekistan on Statistics submitted data on electricity, coal, natural gas and oil through the joint IEA/Eurostat/UNECE annual energy questionnaires. Historical time series were therefore revised by the IEA Secretariat from 1998 to 2017. Motor gasoline has been further revised from 1990 onwards and aviation gasoline from 1996.

In the 2020 edition, data were first incorporated from the annual pilot fuel and energy balances published by the State Committee of the Republic of Uzbekistan on Statistics. As a result, demand data from 2018 onwards display improved disaggregation, breaks in the time series occur between 2017 and 2018.

In the 2018 edition, data on heat were made available from the State Committee of the Republic of Uzbekistan; breaks in time series may occur in 2008.

Prior to 2018, few data are available for biofuels and waste, natural gas demand, and non-energy oil products. As a result, supply data are based on from secondary sources and consumption is estimated.

Fuel inputs to, and electricity and heat outputs from, power plants are estimated by the IEA Secretariat, with estimates from 2018 onwards being better informed by data from State Committee of the Republic of Uzbekistan.

Imports of crude oil are partially estimated by the IEA Secretariat, and may contain other products which are inputs to the refining process.

Zambia

General notes

Data for Zambia are available starting in 1971.

Zambia is one of the ten countries that benefit from EU Support to IEA Data for Affordable and Sustainable Energy System for Sub-Saharan Africa.

In 2021, Indeni refinery closed. As a result, all oil products will be imported in the following years.

In August 2016, a coal thermal power plant with an installed capacity of 300 MW was commissioned in Maamba, Sinazongwe District.

Crude oil imports reported by Zambia’s Energy Regulation Board (ERB) include petroleum feedstocks comprised of crude oil, naphtha, condensate, and gasoil.

In the 2024 edition, solid biofuels and charcoal data has been revised from 2000 onwards with data from AFREC, Ministry of Energy, FAO and IEA secretariat estimates.

In the 2024 edition, imports of LPG and fuel oil for 2022 have been estimated by the IEA secretariat. 2017-2021 data of kerosene and gas/diesel oil have been revised with information from the Energy Regulatory Board, as well as 2021 data for bitumen and non-specified oil products.

In the 2024 edition, coal data has been revised using trade information from UN Comtrade, partial production information from Ministry of Finance and National Planning, estimated power inputs to power to Maamba power station and coal sales from Maamba coal mine. As a result of these revisions to coal data, imports and exports have been revised from 2007 onwards, inputs to power from 2016 onwards, production from 2014 onwards and industrial consumption from 2007 onwards.

In the 2023 edition, many oil products flows were revised or added from 2017 using official data reported by ERB.

In the 2021 edition, new information on the refinery activity available led to revisions of the inputs and outputs value in our data from 2016 onward.

In the 2015 edition, information on refinery yields was obtained and applied to the refinery production from 2001. Therefore, breaks in time series may occur between 2000 and 2001.
A fire damaged the sole oil refinery (Indeni) in Zambia in 2000. Therefore, breaks in time series may occur between 1999 and 2000, as well as between 2000 and 2001.

Methodological notes

This publication is based on the data in physical units of the IEA World Energy Statistics publication, which follow the definitions of the United Nations International Recommendations for Energy Statistics (IRES)\(^6\) and on the IEA energy balance methodology, briefly summarised below.

Energy balance: key concepts

Energy data are generally collected independently across different commodities. Energy statistics are the simplest format to present all the data together, assembling the individual balances of all products, each expressed in its own physical unit (e.g. TJ for natural gas, kt for coal, etc). These are called commodity balances.

However, energy products can be converted into one another through a number of transformation processes. Therefore, it is very useful to also develop one comprehensive national energy balance, to understand how products are transformed into one another, and to highlight the various relationships among them.

By presenting all the data in a common energy unit, the energy balance allows users to see the total amount of energy used and the relative contribution of each different source, for the whole economy and for each individual consumption sector; to compute the different fuel transformation efficiencies; to develop various aggregated indicators (for example consumption per capita or per unit of GDP) and to estimate CO\(_2\) emissions from fuel combustion.

The energy balance is a natural starting point to study the evolution of the domestic energy market, forecast energy demand, monitor impacts of energy policies and assess potential areas for action. The statistician also uses the energy balance as a high-level check on the data accuracy, as large statistical differences in energy units, apparent energy gains or large losses in transformation processes, or large unexplained variations in shares or in high-level indicators may all indicate underlying data problems.

\(^6\) \url{https://unstats.un.org/UNSD/energy/ires/default.htm}. 
The energy balance takes the form of a matrix, where columns present all the different energy sources (“products”) categories and rows represent all the different “flows”, grouped in three main blocks: energy supply, transformation/energy use and final consumption.

To develop an energy balance from the set of commodity balances, the two main steps are: i) all the data are converted to a common energy unit – also allowing to compute a “total” product; and ii) some re-formatting is performed to avoid double counting when summing all products together. For example, for secondary products (e.g. motor gasoline) the production appears in the production row in commodity balances, but is reported as an output of the relevant transformation (e.g. oil refineries) in an energy balance, where the production row only refers to production of primary products (e.g. crude oil).

The methodological assumptions underlying energy balances, discussed in the next section, are particularly important to understand differences across balances derived by different national and international organisations starting from the same energy commodity data.

### IEA energy balances methodology

The unit adopted by the IEA is the tonne of oil equivalent (toe), defined as $10^7$ kilocalories (41.868 gigajoules). This quantity of energy is, within a few per cent, equal to the net heat content of 1 tonne of crude oil. Conversion of the IEA energy balances to other energy units would be straightforward.

The main methodological choices underlying energy balances that can differentiate the final balances layout across organisations are: i) “net” versus “gross” energy content; ii) calorific values; and iii) primary energy conventions.

### Net versus gross energy content

The IEA energy balances are based on a “net” energy content, which excludes the energy lost to produce water vapor during combustion. All the elements of the energy balance are expressed on the same net basis to ensure comparability. Even elements (e.g. natural gas) that in commodity balances may be already in energy units but on a different basis (e.g. “gross”) are converted (e.g. from “gross” to “net”).

The difference between the "net" and the "gross" calorific value for each fuel is the latent heat of vaporisation of the water produced during combustion of the fuel. For coal and oil, the net calorific value is about 5% less than gross, for most
forms of natural and manufactured gas the difference is 9-10%, while for electricity and heat there is no difference as they are not combusted.

### Calorific values

Generally, the IEA adopts country-specific, time-varying, and for some products flow-dependent, net calorific values supplied by national administrations for most products; and regional default values (in conjunction with Eurostat for the European countries) for the oil products. More detailed explanations on the IEA conversion to energy units for the different energy sources are given in Section 2, Units and conversions.

### Primary energy conventions

A very important methodological choice is the definition of the “primary energy equivalent” for the electricity and heat produced from non-combustible sources, such as nuclear, geothermal, solar, hydro, wind. The information collected is generally the amount of electricity and heat produced, represented in the balance as an output of transformation. Conventions are needed to compute the most appropriate corresponding primary energy, input to the transformation, both in form and in amount.

The principle adopted by the IEA is that the **primary energy form** is the first energy form downstream in the production process for which multiple energy uses are practical. For example, the first energy form that can be used as energy in the case of nuclear is the nuclear heat of the reactor, most of which is then transformed into electricity. The application of this principle leads to the choice of the following primary energy forms:

- **Electricity** for primary electricity (hydro, wind, tide/wave/ocean and solar photovoltaic).
- **Heat** for heat and secondary electricity (nuclear, geothermal and solar thermal).

Once the primary energy form is identified for all electricity and heat generated from non-combustible sources, the IEA adopts the **physical energy content method** to compute the corresponding primary energy equivalent amounts: the primary energy equivalent is simply the physical energy content of the corresponding primary energy form.

For primary electricity, such as hydro and solar PV, as electricity is identified as the primary energy form, the primary energy equivalent is simply the gross electricity generated in the plant.
For nuclear electricity, the primary energy equivalent is the quantity of heat generated in the reactors. In the absence of country-specific information, the IEA estimates the primary energy equivalent from the electricity generated by assuming an efficiency of 33%, derived as the average efficiency of nuclear power plants across Europe. Note that the principle of using the heat from nuclear reactors as the primary energy form for the energy statistics has an important effect on any indicators of energy supply dependence. Under the present convention, the primary nuclear heat appears as an indigenous resource. However, the majority of countries using nuclear power import their nuclear fuel, and if this fact could be taken into account, it would lead to an increase in the supply dependence on other countries.

For geothermal electricity, the primary energy equivalent is the quantity of heat and a similar back-calculation is used where the quantities of steam supplied to the plant are not measured, assuming a thermal efficiency of 10%. This figure is only approximate and reflects the fact that the steam from geothermal sources is generally of low quality. If data for the steam input to geothermal power plants are available, they are used directly as primary energy equivalent.

Similarly, for solar thermal plants the heat supply is back-calculated assuming a 33% efficiency of conversion of heat into electricity, reflecting relatively low working temperatures, although central receiver systems can reach higher temperatures and therefore higher efficiencies.

In summary, for geothermal and solar thermal, if no country-specific information is reported, the primary energy equivalent is calculated using the following efficiencies:

- 10% for geothermal electricity;
- 50% for geothermal heat;
- 33% for solar thermal electricity;
- 100% for solar thermal heat.

An alternative to the physical energy content method is the partial substitution method, used in the past by the IEA. In this case, the primary energy equivalent of the electricity generated from non-combustible sources is computed as the hypothetical amount of energy necessary to generate the same amount of electricity in thermal power plants, assuming an average generation efficiency. The method was abandoned by the IEA and other organisations because it had little meaning for countries with significant hydro electricity generation, and because the actual substitution values were hard to establish, as they depended
on the efficiency of the marginal electricity production. It also had unreal effects on the energy balance, as transformation losses appeared without a physical basis.

Since the two methods differ significantly in the treatment of solar, hydro, etc., the share of renewables in total energy supply varies depending on the method. To interpret shares of various energy sources in total supply, it is important to understand the conventions used to calculate the primary energy supply.
Notes on data quality

Methodology

For OECD Member countries, the data shown in this publication are based on information provided in the five annual OECD questionnaires7: “Oil”, “Natural Gas”, “Coal (Solid Fossil Fuels and Manufactured Gases)”, “Renewables and Wastes” and “Electricity and Heat” completed by the national administrations. For the member countries of the Economic Commission for Europe of the United Nations (UNECE) and a few others, the data shown in this publication are mostly based on information provided by the national administrations through the same annual questionnaires. The commodity balances for all other countries are based as much as possible on national official energy data, but also potentially on other data of heterogeneous nature, converted and adapted to fit the IEA format and methodology.

Considerable effort has been made to ensure that the data presented in this publication adhere to the IEA definitions reported in the section on Methodological notes. These definitions, based on the United Nations International Recommendations for Energy Statistics8, are used by most of the international organisations that collect energy statistics.

Nevertheless, energy statistics at the national level are often collected using criteria and definitions which differ, sometimes considerably, from those of international organisations. This is especially true for non-OECD countries, which are submitting data to the IEA on a voluntary basis. The IEA Secretariat has identified and documented most of these differences and, where possible, adjusted the data to meet international definitions.

Recognised differences occurring in specific countries are presented in the section on Country notes and sources. Country notes present the most important deviations from the IEA methodology, and are by no means a comprehensive list of those. To ensure transparency, country notes also describe how data are estimated or revised, where relevant for the data user.

---

7 See link to the annual questionnaires: https://www.iea.org/areas-of-work/data-and-statistics/questionnaires
Estimation

In addition to adjustments addressing differences in definitions, estimations\(^9\) are sometimes required to complete major aggregates, when key statistics are missing.

The IEA secretariat has attempted to provide all the elements of energy balances down to the level of final consumption, for all countries and years. Providing all the elements of supply, as well as all inputs and outputs of the main transformation activities (such as oil refining and electricity generation), has often required estimations. Estimations have been generally made after consultation with national statistical offices, oil companies, electricity utilities and national or international energy experts.

Time series and political changes

The IEA secretariat reviews its databases each year. In the light of new assessments, important revisions may be made to time series of individual countries during the course of this review. Therefore, some data in this publication have been substantially revised with respect to previous editions. Please always consult the section on Country notes and sources.

Generally speaking, energy statistics for some countries undergo continuous changes in their coverage or methodology. Consequently, breaks in time series are considered to be unavoidable.

For example, energy balances for the individual countries of the Former Soviet Union and the Former Yugoslavia have been constructed since 1990 and are not available for previous years. These balances are generally based on official submissions, but estimations also have been made by the IEA secretariat. The section on Country notes and sources describes in detail these elements country by country.

Classification of fuel uses

National statistical sources often lack adequate information on the consumption of fuels in different categories of end use. Many countries do not conduct annual surveys of consumption in the main sectors of economic activity, and published

\(^9\) Data may not include all informal and/or illegal trade, production or consumption of energy products, although the IEA Secretariat makes efforts to estimate these where reliable information is available.
data may be based on out-of-date surveys. Therefore, sectoral disaggregation of consumption should generally be interpreted with caution.

In countries of non-OECD Europe and Eurasia and in China, the sectoral classification of fuel consumption before the reforms of the 1990’s significantly differed from that of IRES. Sectoral consumption was defined according to the economic branch of the user, rather than according to the purpose or use of the fuel. For example, consumption of gasoline in the vehicle fleet of an enterprise attached to the economic branch ‘Iron and steel’ was classified as consumption in the ‘Iron and steel’ industry itself.

Where possible, data have been adjusted to fit international classifications, for example by assuming that most gasoline is consumed in transport. However, it has not been possible to reclassify products other than gasoline and jet fuel as easily, and few other adjustments have been made to other products.

**Imports and exports**

For a given product, imports and exports may not sum up to zero at the world level for a number of reasons. Fuels may be classified differently (i.e. fuel oil exports may be reported as refinery feedstocks by the importing country; NGL exports may be reported as LPG by the importing country, etc.). Other possible reasons include discrepancies in conversion factors, inclusion of international bunkers in exports, timing differences, data reported on a fiscal year basis instead of calendar year for certain countries, and underreporting of imports and exports for fiscal reasons.

**Specific issues by fuel**

**Coal**

Data on sectoral coal consumption are usually reported in metric tonnes. Net calorific values of different coal types used in different end use sectors are not always available. In the absence of specific information, the IEA secretariat estimates end use net calorific values based on the available net calorific values for production, imports and exports.

**Oil**

The IEA secretariat collects comprehensive statistics for oil supply and use, including oil for own use of refineries, oil delivered to international bunkers, and
oil used as petrochemical feedstock. National statistics often do not report all these amounts.

Reported production of refined products may refer to net rather than gross refinery output; consumption of oil products may be limited to sales to domestic markets and may not include deliveries to international shipping or aircraft. Oil consumed as petrochemical feedstock in integrated refinery/petrochemical complexes is often not included in available official statistics.

Where possible, the IEA secretariat has estimated those unreported data, in consultation with the oil industry. In the absence of any other indication, refinery fuel use is estimated to be a percentage (e.g. 5%) of refinery throughput, and where possible, split between refinery gas and fuel oil. For a description of some adjustments made to the sectoral consumption of oil products, see the above section ‘Classification of fuel uses’.

**Natural gas**

Natural gas should be comprised mainly of methane; other gases, such as ethane and heavier hydrocarbons, should be reported under the heading of ‘oil’. The IEA defines natural gas production as the marketable production, i.e. net of field losses, flaring, venting and re-injection.

However, the lack of adequate definitions makes it difficult or impossible to identify all quantities of gas at all different stages of its separation into dry gas (methane) and heavier fractions. National data for natural gas do not always explicitly show separate quantities for field losses, flaring, venting and re-injection.

Natural gas supply and demand statistics are normally reported in volumetric units and it is difficult to obtain accurate data on the calorific value. In the absence of specific information, the IEA generally applies an average gross calorific value of 38 TJ/million m³.

For the countries that report natural gas data at temperature and pressure conditions of 20°C and 101.325 kPa, the calorific values are about 1.7% lower than the equivalent at temperature and pressure conditions of 15°C and 101.325 kPa. However, in energy terms no difference is observed between the two reporting conditions as natural gas volumes measured at 20°C and 101.325 kPa are 1.7% higher than natural gas volumes at 15°C and 101.325 kPa.

Reliable consumption data for natural gas at a disaggregated level are often difficult to find. This is especially true for some of the largest natural gas
consuming countries in the Middle East. Therefore, industrial use of natural gas for these countries is frequently missing from the data published here.

**Electricity**

The IEA classification shows ‘main activity producers’ separately from ‘autoproducers’ of electricity and heat. An autoproducer of electricity is an establishment which, in addition to its main activities, generates electricity wholly or partly for its own use. For non-OECD countries, data on autoproducers are not always reported. In such cases, the quantities of fuels used as input to electricity are included under the appropriate end-use sector.

When statistics of production of electricity from biofuels and waste are available, they are included in total electricity production. However, these data are not comprehensive; for example, much of the electricity generated from waste biomass in sugar refining facilities remains unreported.

When unreported, inputs of fuels for electricity generation are estimated using information on electricity output, fuel efficiency and type of generation capacity.

**Heat**

For heat, transition economies (countries of non-OECD Europe and Eurasia) and China used to adopt a different methodology from that adopted in market economies. They allocated the transformation of primary fuels (coal, oil and gas) by industry into heat for consumption on site to the transformation activity ‘heat production’, not to industrial consumption, as in the IEA methodology 10. The transformation output of Heat was then allocated to the various end use sectors.

The losses occurring in the transformation of fuels into heat in industry were not included in final consumption of industry.

Although a number of countries have recently switched to the practice of international organisations, this important issue reduces the possibility of cross-country comparisons for sectoral end use consumption between transition economies and market economies.

---

10 For autoproducer plants, the international methodology restricts the inclusion of heat in transformation processes to that sold to third parties.
Biofuels and waste

The IEA publishes data on production, domestic supply and consumption of biofuels and waste for all countries and all regions.

Data for non-OECD countries are often based on secondary sources and may be of variable quality, which makes comparisons between countries difficult. For many countries, historical data are derived from surveys which were often irregular, irreconcilable and conducted at a local rather than national level.

Where official data are incomplete or unavailable, the IEA Secretariat estimates the time series based on economic indicators and secondary sources. Those estimated time series should be treated very cautiously. The chart below provides a broad indication of the estimation methodology and of the data quality by region.

Given the importance of vegetal fuels in the energy picture of many developing countries, balances down to final consumption by end-use for individual products or product categories have been compiled for all countries.

The IEA hopes that the inclusion of these data will encourage national administrations and other agencies active in the field to enhance the level and quality of data collection and coverage for biofuels and waste. More details on the methodology used by each country may be provided on request and comments are welcome.

Energy content

**Coal**

Coal has separate net calorific values for production, imports, exports, inputs to electricity/heat generation and coal used in coke ovens, blast furnaces and industry.

For electricity/heat generation, coal inputs to each type of plant (i.e. main activity electricity plant, autoproducer electricity plant, main activity CHP plant, autoproducer CHP plant, main activity heat plant, autoproducer heat plant) are converted to energy units using average factors calculated from the Annual Electricity Questionnaire. All other flows are converted using an average net calorific value.

**Crude oil**

Country-specific net calorific values (NCV) for production, imports and exports by country are used to calculate the balances. The average value is used to convert all the other flows to heat values.

**Gases**

*World Energy Statistics* expresses the following gases in terajoules, using their gross calorific value.

Gas data provided in joules should be converted as follows: Data in TJ / 41 868 = Data in Mtoe.
To calculate the net heat content of a gas from its gross heat content, multiply the gross heat content by the appropriate following factor.

<table>
<thead>
<tr>

</tbody>
</table>

**Biofuels and waste**

The heat content of primary solid biofuels, biogases, municipal waste and industrial waste, expressed in terajoules on a net calorific value basis, is presented in *World Energy Statistics*. The Secretariat does not receive information on volumes and other characteristics of these fuels.

Data in TJ / 41 868 = Data in Mtoe. Data for charcoal are converted from tonnes using the average net calorific values given in the electronic tables.

Unless country-specific information has been provided, data for biogasoline are converted from tonnes using 26 800 kJ/kg. Biodiesels and other liquid biofuels are assumed to have a net calorific value of 36 700 kJ/kg unless otherwise specified.

**Oil products**

For oil products, the IEA applies regional net calorific values (in conjunction with Eurostat for the European countries), except for the individual countries listed in the table at the end of this section.

**Electricity**

Figures for electricity production, trade, and final consumption are calculated using the energy content of the electricity. Electricity is converted as follows: Data in TWh x 0.086 = data in Mtoe.

Hydro-electricity production (excluding pumped storage) and electricity produced by other non-thermal means (wind, tide/wave/ocean, solar PV, etc.) are accounted for similarly. Gross electricity generation in TWh x 0.086 = primary energy equivalent in Mtoe.
The primary energy equivalent of nuclear electricity is calculated from the gross generation by assuming a 33% conversion efficiency. The calculation to be carried out is the following: gross electricity generation in TWh x 0.086 / 0.33 = primary energy equivalent in Mtoe.

In the case of electricity produced from geothermal heat, if the actual geothermal efficiency is not known, then the primary equivalent is calculated assuming an efficiency of 10%. The calculation to be carried out is the following: gross electricity generation in TWh x 0.086 / 0.10 = primary energy equivalent in Mtoe.

For electricity produced from solar thermal heat, the primary equivalent is calculated assuming an efficiency of 33% unless the actual efficiency is known. The calculation to be carried out is the following: gross electricity generation in TWh x 0.086 / 0.33 = primary energy equivalent in Mtoe.

Heat

Information on heat is supplied in terajoules and is converted as follows: Data in TJ / 41 868 = Data in Mtoe.

In the case of heat produced in a geothermal plant, if the actual geothermal efficiency is not known, then the primary equivalent is calculated assuming an efficiency of 50%. The calculation to be carried out is the following: Heat production in TJ x 0.0000238 / 0.50 = primary energy equivalent in Mtoe.

For heat produced in a solar thermal plant, the primary equivalent is equal to the heat consumed. Data in TJ / 41 868 = data in Mtoe.

For direct use of geothermal and solar thermal heat, all the heat consumed is accounted for in production and consumption.

Examples

The following examples indicate how to calculate the net calorific content (in ktoe) of the quantities expressed in original units in World Energy Statistics.
