

The Role of Critical Minerals in Clean Energy Transitions

Launch presentation

Paris, 5 May 2021

Context

- Countries accounting for more than 70% of today's global GDP and emissions have committed to net-zero emissions, implying a massive acceleration in clean energy deployment
- An energy system powered by clean energy technologies needs significantly more minerals, notably:
 - Lithium, nickel, cobalt, manganese and graphite for batteries
 - Rare earth elements for wind turbines and electric vehicles motors
 - Copper, silicon and silver for solar PV
 - Copper and aluminium for electricity networks
- There is no shortage of mineral resources, but recent price rises for cobalt, copper, lithium and nickel highlight how supply could struggle to keep pace with the world's climate ambitions
- An evolving energy system calls for an evolving approach to energy security; policy makers must expand their horizons and act to reduce the risks of price volatility and supply disruptions

The shift to a more mineral-intensive energy system

Minerals used in selected energy technologies

A typical electric car requires six times the mineral inputs of a conventional car, and an offshore wind plant requires thirteen times more mineral resources than a similarly sized gas-fired power plant

Meeting climate goals will turbo-charge demand for minerals

Mineral demand for clean energy technologies by scenario

Demand for critical minerals is set to soar over the next two decades as the world pursues net zero goals; overall requirements rise by as much as 6 times, but individual minerals, led by lithium, rise even faster

Clean energy in the driving seat for mineral demand growth

Share of clean energy technologies in total demand for selected minerals in the SDS

As learning and economies of scale bring down other cost components, mineral inputs also account for an increasingly large share of the total cost of batteries and other key clean energy technologies

New reasons to go underground

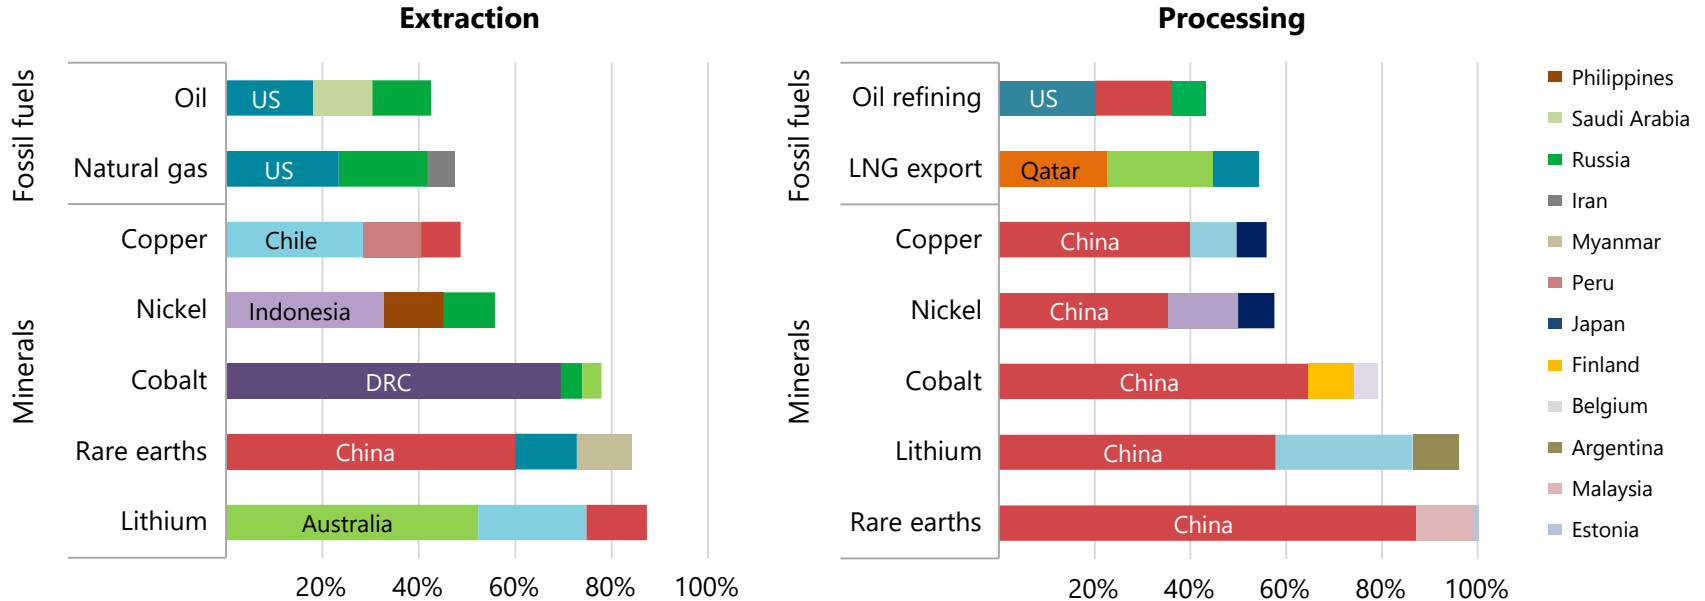

Revenue from production of coal and selected energy transition minerals in the SDS

Today's revenue from coal production is ten times larger than from energy transition minerals. However, in climate-driven scenarios, these positions are reversed well before 2040

Many mineral supply chains lack diversity

Share of top three producing countries in production of selected minerals and fossil fuels, 2019

Production and processing of many minerals such as lithium, cobalt and some rare earth elements are geographically concentrated, with the top three producers accounting for more than 75% of supplies

A looming mismatch between mineral supply and climate ambition

Committed mine production and primary demand (SDS) for selected minerals

Today's investment plans are geared to a world of gradual change; given long leads times for new projects, an accelerated energy transition could quickly see demand running ahead of supply

Critical minerals do not undermine the case for clean energy

Comparative life-cycle GHG emissions of a mid-size battery electric versus a conventional car

Even though mineral extraction is relatively emissions-intensive, on average the full lifecycle emissions of an EV bought today are around half those of a conventional car

Recycling becomes a significant source of supply

Contributions from spent lithium-ion batteries from EVs and storage to reducing primary demand in the SDS

By 2040, recycled quantities of copper, lithium, nickel and cobalt from spent batteries could reduce combined primary supply requirements for these minerals by around 10%

IEA plan of action: a comprehensive approach to mineral security

Building on the IEA's leadership role in energy security, these six key areas of action can ensure that critical minerals enable an accelerated transition to clean energy

- 1. Ensure adequate investment in diversified sources of supply**
- 2. Promote technology innovation at all points along the value chain**
- 3. Scale up recycling**
- 4. Enhance supply chain resilience and market transparency**
- 5. Mainstream higher environmental, social and governance standards**
- 6. Strengthen international collaboration between producers and consumers**
