*Figure 1 – Form of final energy consumption in the EU*

**Source: Common Vision for the Renewable Heating & Cooling sector in Europe  
European Technology Platform on Renewable Heating and Cooling**

**Renewables**

**Potentials**

# Denmark 2050: All fossil fuels phased out - 2035: All heat and electricity from renewables

Et energisystem uden fossile brændsler

## Wind energy:

2014, first 6 months: 41% of electricity consumption

2020: 50 % of increased electricity consumption (incl. transport, heat pumps, ...)

## Solar heating:

2030: 15% of decreased heating demand

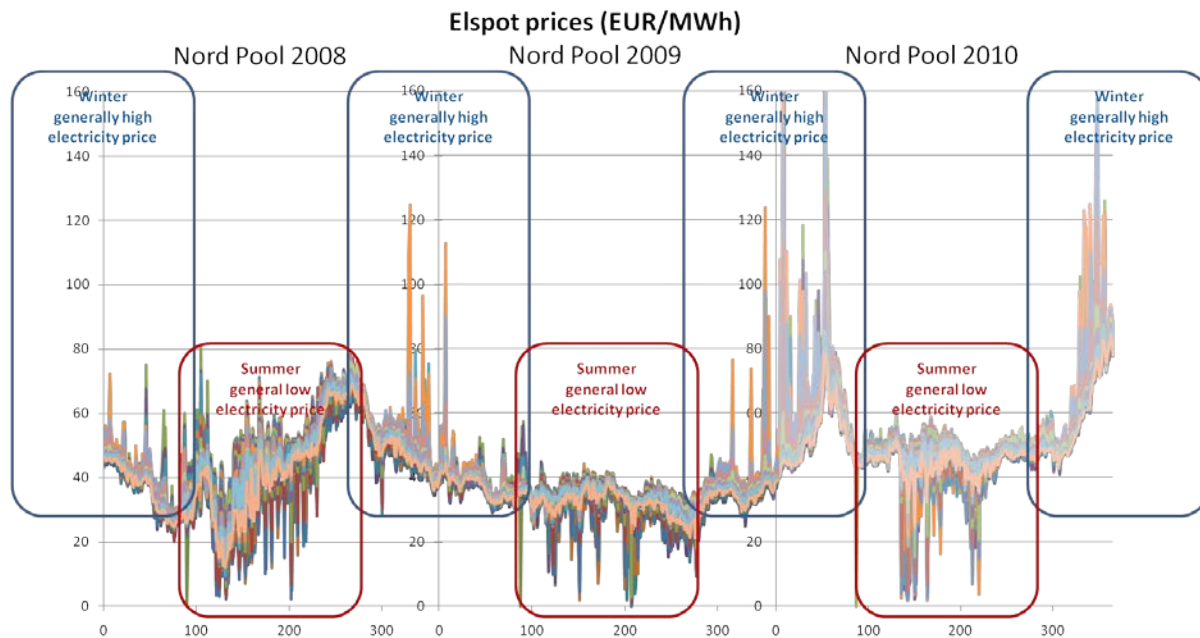

2050: 40% of decreased heating demand - 80% of this by solar heating plants & 20% individual systems

# Solar heating systems must have a good interplay with liberal electricity market

## Problem:

As renewable electricity production increases:

- mismatch of production and load will increase
- dynamics of the electricity price will increase

# Interplay with liberal electricity market

## Solution:

Combined technologies and **smart heat storage** interacting with the electricity grid ...

# Benefits from combining technologies and using heat storage

## Solar:

- ✓ Produce free heat

## Heat pump:

- ✓ Produce cheap heat
- ✓ Fast capacity regulation (load) → earn money
- ✓ Reduce storage volume

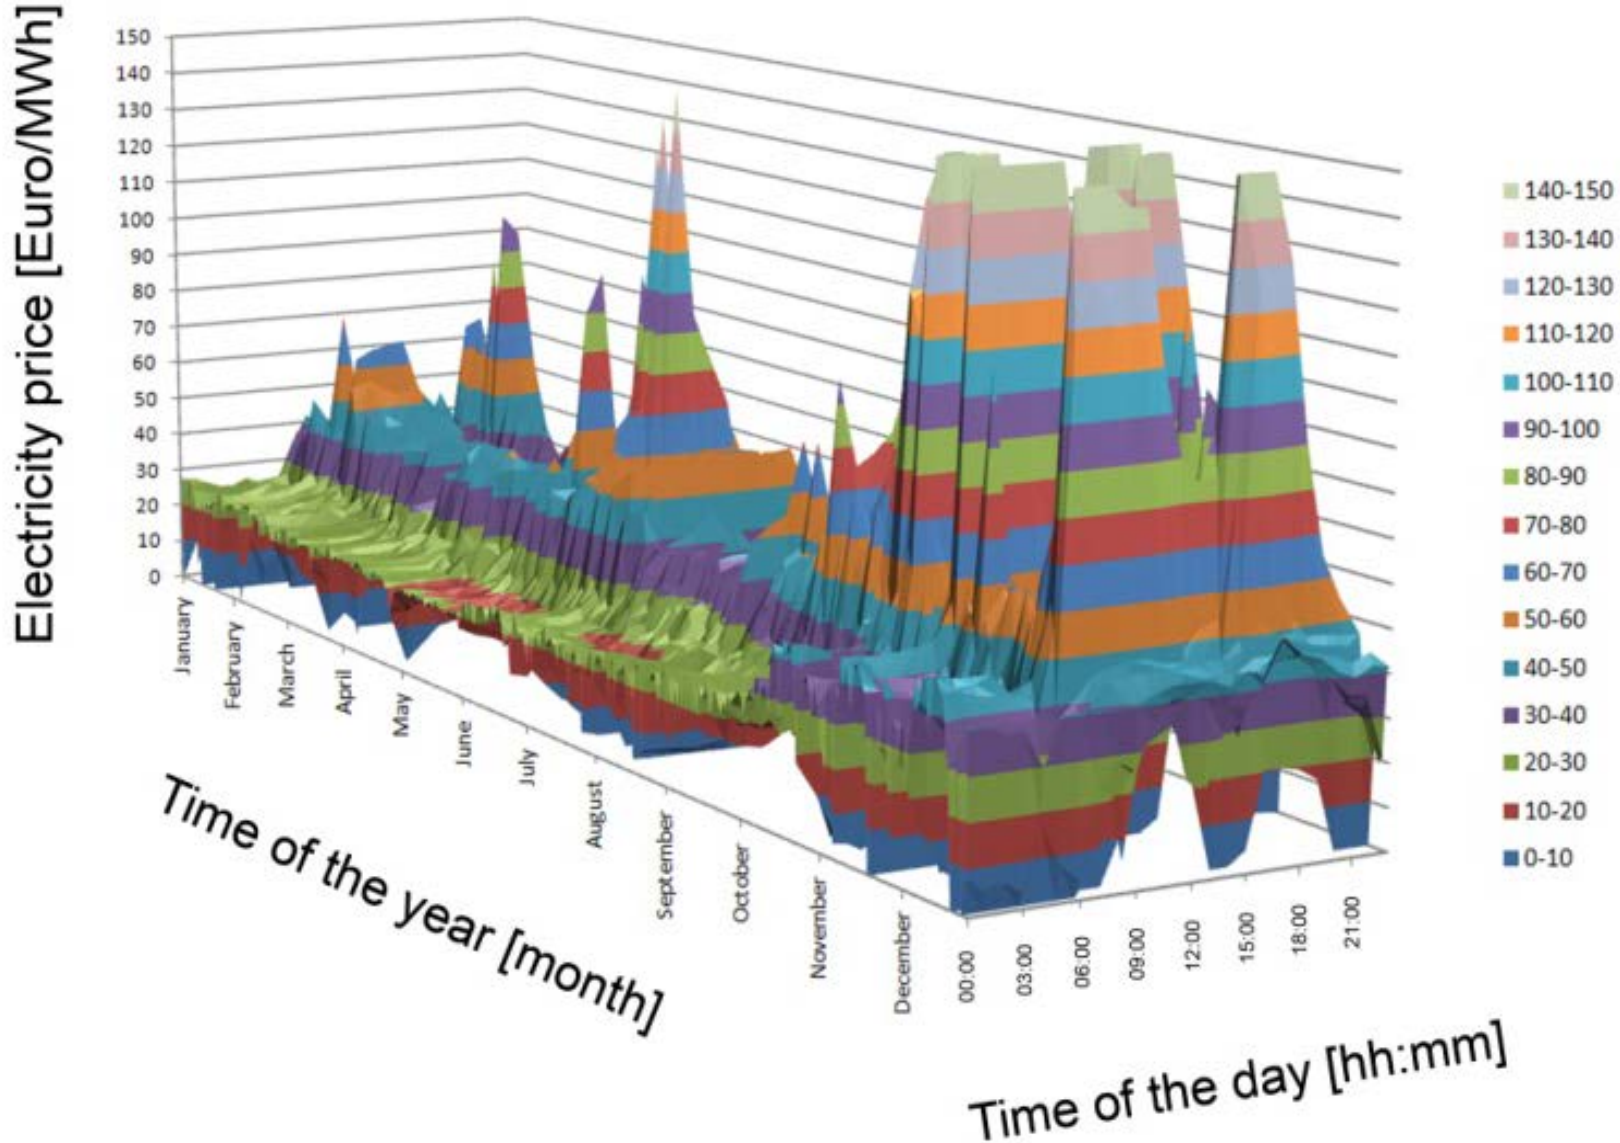

## CHP:

- ✓ Produce valuable electricity → earn money
- ✓ Fast capacity regulation (prod.) → earn money

## Smart heat storage:

- ✓ Gives the flexibility
- ✓ Makes the combinations of technologies possible

# Electricity price variations during one year

# Solar heating plant - principle

Heat exchanger

Solar collector field

Consumers

District heating boiler plant

# Solar heating plants

Marstal 33365 m<sup>2</sup>

Ulsted 5012 m<sup>2</sup>

Jægerspris 13405 m<sup>2</sup>

Dronninglund 37573 m<sup>2</sup>

# Total solar collector area of Danish solar heating plants

# Interaction with dynamic electricity production

Simple solar heating plants with solar fractions of 5-25% are most common so far, collector areas about 10000 m<sup>2</sup>

But it seems also to be cost effective to go for higher solar fractions/**long term heat storage** due to:

- Simple heat storage technologies
- Large heat storages with small heat losses and low costs per volume
- Interplay with liberal electricity market
- Advantages by combining technologies

# Cheap storage technology, water pond and borehole storage

**Heat capacity per volume:**

- Water: 4.1 MJ/Km<sup>3</sup>
- Soil: About 2.7 MJ/Km<sup>3</sup>

# Marstal - seasonal heat storage - 75000 m<sup>3</sup> water pond

## Dronninglund - seasonal heat storage - 60000 m<sup>3</sup> water pond

# •Water ponds under construction:

- Vojens: 200000 m<sup>3</sup>
- Gram: 110000 m<sup>3</sup>

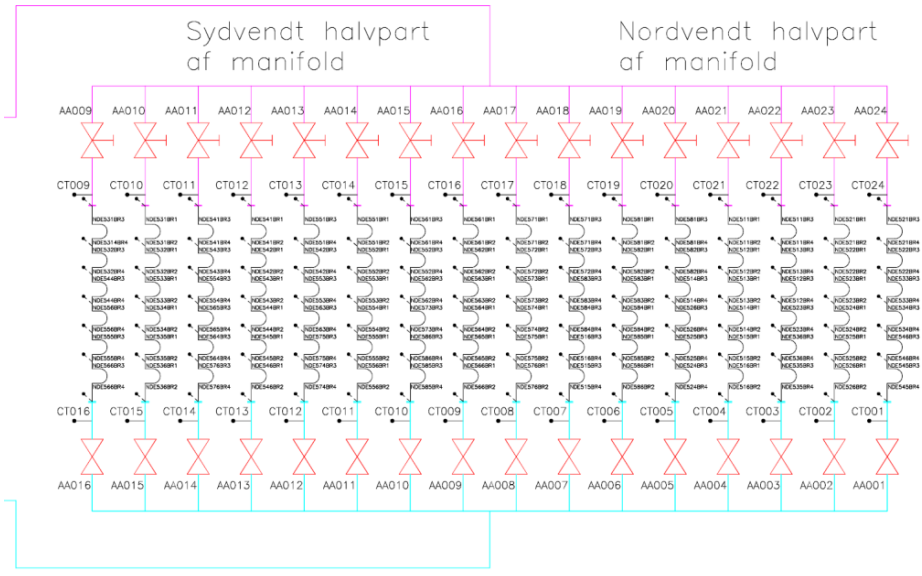

# 19000 m<sup>3</sup> borehole storage in Brædstrup

# Design and implementation, Brædstrup

# Design and implementation, Brædstrup

# Measurements

	Borehole storage, Brædstrup	Water pond storage, Marstal
Size	19000 m <sup>3</sup> soil, corresponding to about 12000 m <sup>3</sup> water	75000 m <sup>3</sup> water
Prize	240000 euro, corresponding to about 20 euro/m <sup>3</sup> water	2400000 euro, corresponding to 32 euro/m <sup>3</sup> water
Maximum storage temperature	50°C	90°C
Heat recovered from heat storage during first year, 2012-2013	44%	18%
Heat recovered from heat storage during second year, 2013-2014	38%	65%

# Individual solar/electric heating system for the future smart energy system

**Individual** solar/electric heating systems with smart heat storages, which can be heated by solar collectors and by electricity in periods with low electricity prices

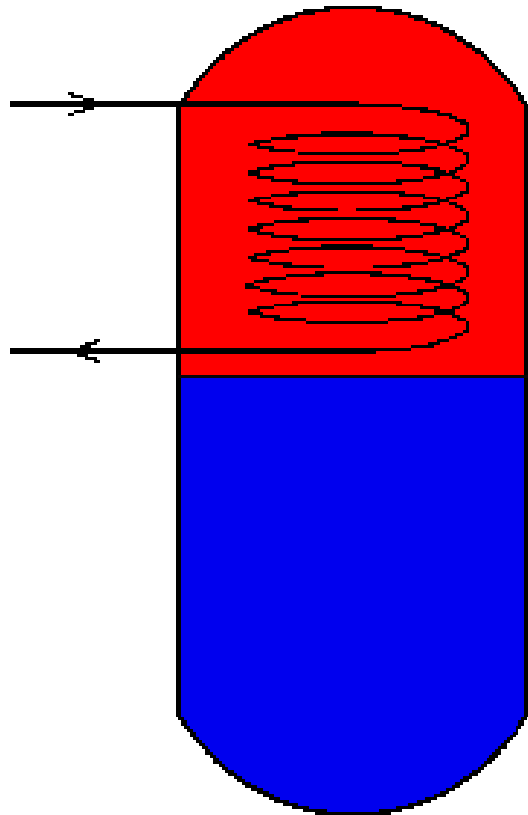

- Heat is produced by solar collectors and by electric heating elements or a heat pump
- Electric heating elements/heat pump if possible only in operation in periods where solar heat can not fully cover heat demand and where the electricity price is low
- System equipped with a smart heat storage (variable auxiliary volume) and a smart control system based on prognoses for:
  - heat demand
  - solar heat production
  - electricity price

# Smart solar tanks for solar heating systems

## Marketed Solar tank

## Smart solar tank

**TANK HEATED FROM THE TOP**

**INDIVIDUAL FLEXIBLE  
TIMER/ENERGY CONTROL SYSTEM**

## Solar heating systems with smart solar tanks

Increased thermal performance by up to 35% due to:

- ☺ Decreased tank heat loss
- ☺ Increased solar heat production

Further, also additional improved cost efficiency due to:

- ☺ Use of low electricity price

# Systems tested side by side

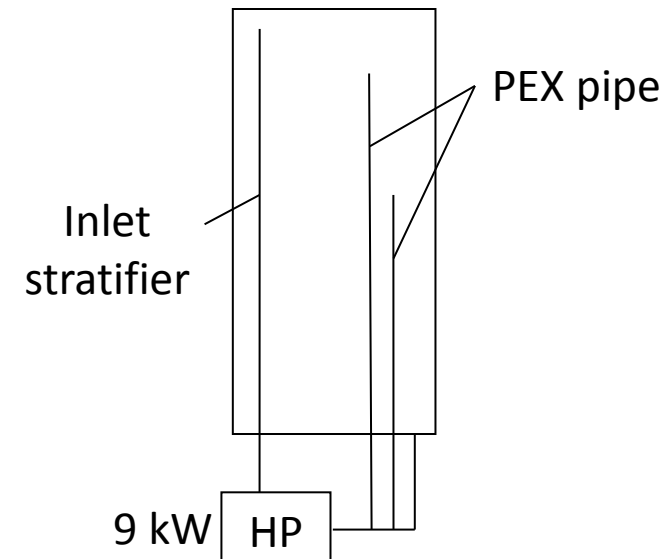

- 9 m<sup>2</sup> solar collector
- 735 l smart solar tank. Auxiliary: One electric heating element, three electric heating elements, heat pump
- Smart control system - heat content in tank, weather forecast, coming heat demand, coming solar heat production, coming electricity prices from NORDPOOLSPOT

## Solar collector loop & discharge loops

## Auxiliary heating principles

# Measured results for spring 2013

- Electricity consumption of system with electric heating element(s) = 2.2 x electricity consumption of system with heat pump
- Heat price for systems with electric heating element(s) = 2 x Heat price for system with heat pump

## Theoretical calculations - results

### Home owner

- Heat price for house: 100%
- Heat price for house with 10 m<sup>2</sup> solar combi system: 70-80%

### **Strongly influenced on policy on tax on electricity:**

- Heat price for house with 10 m<sup>2</sup> smart solar heating system with electric heating elements and variable electricity price: 65-75%
- Heat price for house with 10 m<sup>2</sup> smart solar heating system with heat pump and variable electricity price: 35-40%

### Society

- Socio-economic benefit of smart solar heating systems compared with a reference scenario with oil and gas boilers: The total benefit: 2200 - 6100 DKK per system per year

# Conclusions

## **Centralised solar heating systems with smart long term heat stores**

- Water pond and borehole storages promising technologies for solar heating plants

## **Individual solar heating systems with smart solar heat stores**

- Individual smart solar heating systems with electric heating elements/heat pump and variable electricity price are more cost-effective than traditional solar heating systems
- Individual smart solar heating systems with electric heating elements/heat pump can help integrating wind power in the energy system and contribute to an increased share of renewable energy

## **Recommendations**

### **Increase research, development and demonstration efforts on:**

- Water ponds
- Borehole storages
- Individual smart solar/electric heating systems for low energy buildings
- Individual smart solar/heat pump systems for normal houses

**Thank you for your attention**
