One system for health and Social
Care
Development of team based
working across Sunderland
Mental and Physical health

Quality-Adjusted Life Year

QALY = length of life x quality of life

The QALY is a measure of disease burden, which evaluates the impact of disease (or treatment) on both length and quality of life

A QALY is calculated by aggregating the length of time spent in a particular health state, weighted by the relative value of that health state; valued between 0 (death) and 1 (perfect health)

For instance, if a medicine provides an additional 2 years of life with a health state rated at 75% (0.75) quality of life, this will equate to 1.5 QALYs (2 x 0.75)

In the UK, the National Institute for Health and Care Excellence (NICE) recommends the QALY as the primary outcome measure in cost-effectiveness analysis of health care interventions.

Although there are some limitations to the QALY, it is still considered the gold-standard outcome measure in health economics.

What we've achieved so far

- 6 homes currently improved
- 63 interactions with NHS in previous 6 months
- Average spend on home £5,000
- Participants are included in our wider QALY study
- Two further trials underway with in Durham and Northumberland areas of the North East of England
- Creating a national study to increase statistical significance. has the potential to increase the number of homes improved to 300+
