

Energy Efficiency Indicators: Fundamentals on Statistics

Roberta Quadrelli

Head - Energy Balances, Prices, Emissions, Efficiency

IEA - Energy Data Centre

***2015 Interenerstat meeting
IEA, Paris, September 2015***

IEA's energy efficiency indicators work

- **Produce meaningful cross-country analysis to provide guidance to policy-makers on:**
 - Underlying drivers (economic activity & structure, income, prices...)
 - Trends in energy use and CO₂ emissions
 - Energy efficiency opportunities and progress
 - Policy effectiveness

- **Establish a harmonised framework for data collection and analysis**
 - Harmonisation => Comparability
 - Comparability => Understanding of global trends and drivers

Request from member countries to provide a common methodological framework

A set of two IEA efficiency manuals: statistics and policy

Manual on statistics to support the recently established IEA end-use data collection

 Draft Energy Efficiency Indicators Template country name	
COUNTRY DATA SECTION (to be reviewed and updated)	
MACRO ECONOMIC DATA	Macro economic and activity data
COMMODITIES	Production outputs from selected energy-consuming industries
INDUSTRY	Energy consumption by ISIC categories
SERVICES	Energy consumption by end-uses in the services sector
RESIDENTIAL	Household energy consumption by end-uses and selected appliances data
TRANSPORT	Energy and activity data for passenger and freight transport
IEA DATA and AGGREGATE INDICATORS	
ELECTRICITY GENERATION	Electricity generation from combustible fuels and efficiencies
BASIC INDICATORS	Predetermined set of aggregate energy and activity indicators
SUPPORT TOOLS	
USER REMARKS	To incorporate comments associated to the data from the individual sheets
DATA COVERAGE	Generates a graphical summary of data coverage (completed vs. expected)
SINGLE INDICATOR GRAPHS	To generate a graph for one energy indicator
MULTIPLE INDICATORS GRAPHS	To generate a graph comparing trends from multiple indicators
CONSISTENCY CHECKS	To run the integrated consistency checks

As an answer to a request from IEA Ministers in 2009, the IEA designed a template to collect data for energy efficiency indicators.

The manual on statistics for energy efficiency indicators

Providing a harmonized framework for data collection across sectors and end-uses

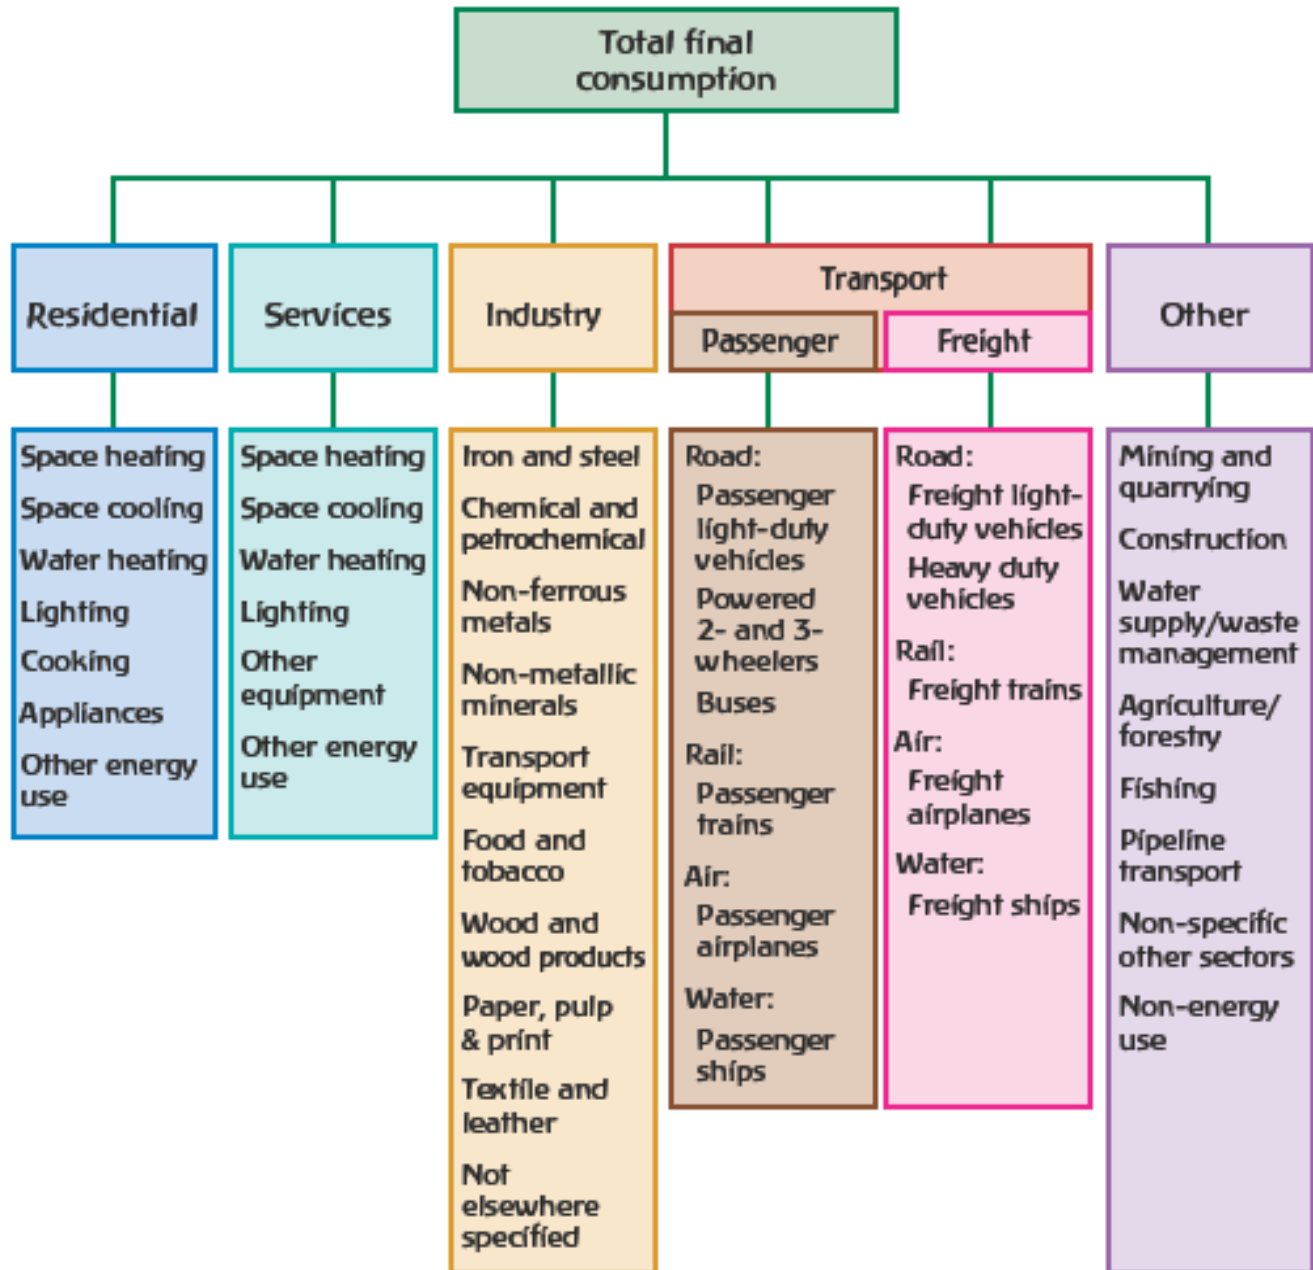

Table of Contents

- 1 Introduction
- 2 What are Energy Efficiency Indicators?
- 3 How to Collect the Data for Energy Efficiency Indicators?
- 4 Collecting What and How for the Residential Sector
- 5 Collecting What and How for the Services Sector
- 6 Collecting What and How for the Industry Sector
- 7 Collecting What and How for the Transport Sector
- 8 Validating the Data
- 9 Disseminating the Data
- Annexes

Shares of sectors in total final consumption for the world (1973 and 2011)

What data? Understanding end uses

The need to collect more disaggregated data

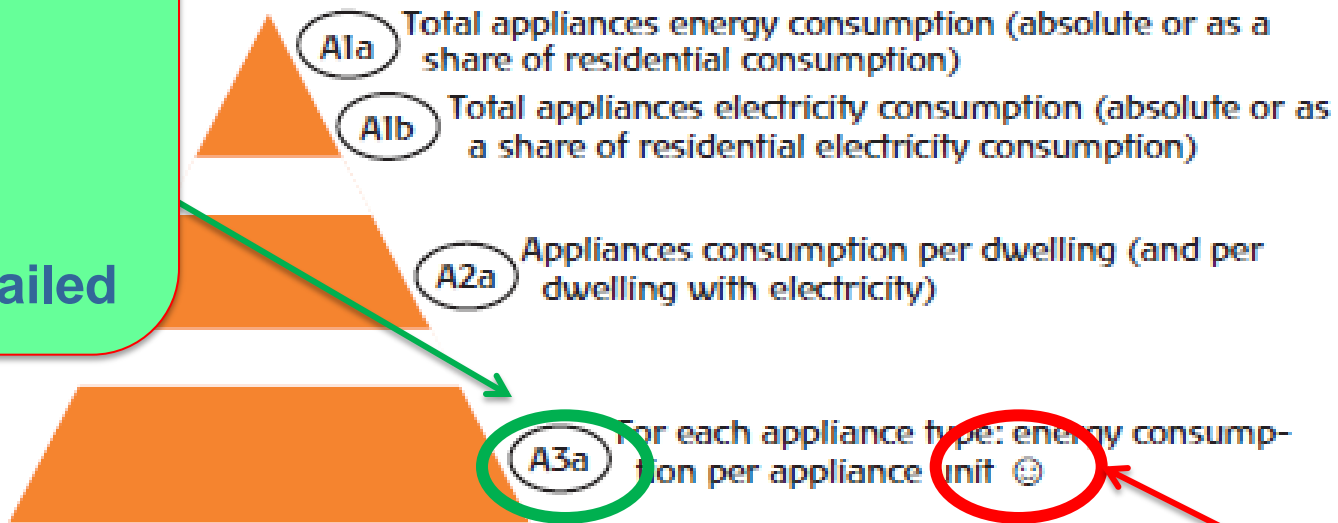

End use indicators: a variable level of detail

4 Residential

Appliance indicators.....

The top of the pyramid groups all the appliances into two indicators, the first one showing total energy use for appliances either in absolute value or in relative terms compared to total energy consumption of the residential sector (A1a); and the second one, as in the case of cooling and lighting, showing the same indicator but just for electricity since electricity is almost the only energy source used for appliances

Pyramid of residential appliances indicators

For each end use:
Indicators pyramid
1 – general
2 – detailed
3 – very detailed

For each indicator of levels 2 and 3, the table gives the name, its coverage (overall or by specific type), the energy data and the activity data to be used. The column before the last gives the code number for the indicator and, when it applies, the last column highlights if the indicator is considered as the preferred indicator for a particular end-use.

20

A smiley face indicates the recommended indicator

Collecting relevant data as the key challenge

Table 7.3 • Summary of the main data needed for transport indicators and examples of possible sources and methodologies

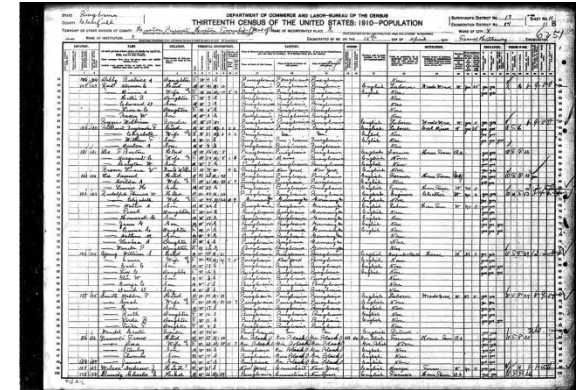

Data	Source	Methodology
Energy data		
Total transport consumption	National energy balance National energy statistics	Administrative sources Modelling
Consumption by sub-sector	National energy balance National energy statistics	Administrative sources Mobility surveys Modelling
Consumption by segment		Mobility surveys Modelling
Consumption by vehicle type		Mobility surveys Modelling
Activity data		
GDP, population	National statistics offices	Administrative sources
Vehicle-km (vkm)	Vehicle registers/ Roadworthiness testing services/ Inspecting organisations	Measurements: odometer readings
	Municipalities/Transport authorities	Measurements: road traffic count
	National and international databases Transport ministries	Administrative sources Mobility surveys Modelling
Passenger-km (pkm)	National and international databases Transport ministries	Administrative sources Mobility surveys
Tonne-km (tkm)	National and international databases Transport ministries	Administrative sources Mobility surveys, freight surveys

How do countries collect data?

Four main types of methods

Methods used to collect data for indicators

- Administrative sources

THIRTEENTH CENSUS OF THE UNITED STATES: 1910-POPULATION

This is a large, multi-column table containing detailed population statistics for the year 1910, organized by state and county. It includes various demographic and economic indicators.

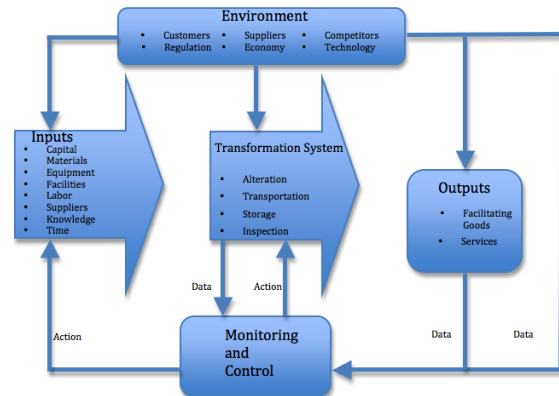

- Surveys

- Metering and measuring

- Modelling

Methods: sharing expertise from countries

Annex D:

160 country practices presented one by one

grouped by sector by methodology

Background	Country	Austria	R/Su/01
	Organisation	Statistics Austria	
	Name of the survey	Household energy consumption survey	
	Survey purpose	<ul style="list-style-type: none"> To determine total household energy consumption To determine household appliances energy consumption To collect household energy expenditure To collect dwelling physical characteristics To collect household occupant characteristics 	

Data collection	Sample design	Stratified random sampling approach		
	Sample sources	List of addresses, list of telephone numbers, labour force survey.		
	Collection methods	<ul style="list-style-type: none"> Computer assisted personal interview (CAPI) Computer assisted telephone interview (CATI) 		
	Sample/Population size	14 000 / 3 429 720	Response rate	55%
	Frequency	Every two years	Last time surveyed	2010
	Time to complete survey	10 minutes	Mandatory	No
	Incentive	None		
	Survey respondents	Households		
	Elements collected	Dwelling type, dwelling floor area, building age, household occupancy, energy-related renovations, household energy consumption and related expenditures.		
	End-uses collected	Space cooling, space heating, domestic hot water, other: cooking.		

Notes and comments	Main challenges	<ul style="list-style-type: none"> Inconsistent responses Response quality
	Possible improvements	
	Key best practice	A new approach to data control compared with previous surveys was taken for the first time in 2004 and continued in the follow-up survey runs. Up to and including the 2000 survey, only the individual energy sources themselves were checked for plausibility, any missing data were calculated (quantity-value pairs) and substitutions were made if necessary. Such routines of course continue to be used, with the additional step that the total of the reported energy consumption is then related to a calculated (fictitious) overall consumption. This fictitious overall consumption by the household is calculated from the data for that household, on the one hand (floor space, number of people in household) and pre-set parameters for the individual types of use (space heating, water heating, cooking, other purposes), on the other hand. Calculating the total reported energy consumption per household in this way involves some quite complicated plausibility routines, because one or more alternative quantities have to be calculated if the quantity-value pairs do not match and these alternative quantities then, when variably applied, lead to a number of different calculated overall energy consumption figures. The fictitious standard value is then used to select the quantity-value pairs that appear most probable.

International Energy Agency > EE Indicators Manual

- A supplement to the publication Energy Efficiency Indicators: Fundamentals on Statistics , this database presents practices on collection of data for developing efficiency indicators from a variety of OECD and non-OECD countries.
- Practices are searchable by country, sector, methodology and type of available documentation. By sharing these experiences, we hope to help countries and organisations to improve their own energy efficiency indicators programmes.

Countries	Sector	Methodology	Available content	Search by keywords
<input type="checkbox"/> Israel <input type="checkbox"/> Italy <input type="checkbox"/> Japan <input type="checkbox"/> Kazakhstan <input type="checkbox"/> Korea, Republic of	<input type="checkbox"/> Industry <input type="checkbox"/> Residential <input type="checkbox"/> Services <input type="checkbox"/> Transport	<input type="checkbox"/> Administrative sources <input type="checkbox"/> Measuring <input type="checkbox"/> Modelling <input type="checkbox"/> Surveying	<input type="checkbox"/> methodology <input type="checkbox"/> project web site <input type="checkbox"/> questionnaire <input type="checkbox"/> report <input type="checkbox"/> results	<input type="text"/>

A platform to share expertise worldwide: practices are available in a searchable database.

The IEA logo consists of a large, semi-transparent green circle. Inside this circle, the letters "iea" are written in a lowercase, sans-serif font. The "i" has a white dot. The "e" and "a" are green, matching the background of the circle. The logo is positioned in the lower right quadrant of the slide.
