

InterEnerStat Meeting

Harmonisation of Definitions of Energy Products and Flows

IEA, Paris, 28-30 October 2008

Background and Objectives

Jean-Yves Garnier
Head, Energy Statistics Division
International Energy Agency

- 👉 **A short background**
- 👉 **Three years of InterEnerStat**
- 👉 **The 3rd InterEnerStat meeting**
 - **Preparation**
 - **Objective**

Quality of energy statistics was declining in the early 2000's

Completeness

- More and more data are estimated
- More and more data are missing and/or confidential
- Less and less details, more aggregation (CHP, public vs. autoproducers, ...)

Quality

- Efficiency of power plants $> 100\%$
- Subtotals do not add up to totals
- Large statistical difference ($>20\%$)
- Breaks in time series - no revisions in time series
- "Other sectors" often used as a balancing item

Timeliness

- More and more time to collect, process, check and release data

Complete Free Supply and Demand Breakdown Time Series

Supply and Consumption for Heat (TJ) - Tables 3 and 4

1989 1990 1991 1992 1993 1994 1995 1996 1997 1998 1999 2000

There are many reasons behind this deterioration

New developments make the tasks of statisticians even harder:

- 👉 **Liberalisation of the market:**
From one company to hundreds
- 👉 **Confidentiality (linked to liberalisation)**
- 👉 **More work passed to statistics offices:**
 - **More companies to survey (liberalisation)**
 - **Renewables (remote information)**
 - **Energy efficiency indicators (including socio-economic data)**
 - **Environment (estimation of GHG emissions,)**
 - **Etc.**
- 👉 **Resources do not follow work load:**
Statistics still have a low profile, budget cuts
- 👉 **Fast turnover in staff: lack of experience, continuity**

A Need to Act and React

At the policy maker Level

- They are the ones who provide the resources
- At the end of the day, they are the ones who will be suffering from the lack of good quality data

At the technical level

- Statisticians often lack resources
- A need to compensate fast turnover

The JODI initiative is certainly the best example of what working together could do in improving transparency and data quality and in raising profile of statistics and statisticians

What has JODI changed

● How Statistics is Viewed by Policy Makers and Analysts

- ➔ Policy makers and analysts have realised that building a detailed, timely and reliable global database on oil supply and demand cannot happen overnight.
- ➔ It involves political commitment, a great deal of cooperation between companies, countries and organisations. It also needs proper resources.
- ➔ The place and role of statistics and statisticians have certainly benefited from JODI

● Introduction

On 19 November 2005, King Abdullah launched the JODI database live on internet

➔ The number of JODI partner organisations is increasing

➔ The strengthening of the links between JODI partner organisations is increasing

➔ The momentum to further develop JODI is increasing not only on oil statistics but also on other energy statistics

A short background

- At the 36th Session of the UN Statistical Commission, energy was in the spotlight of the Commission
- This led to the Ad-hoc Energy Group Meeting on 23-25 May 2005 organised by UNSD in New York
- This subsequently led to the recommendation to establish
 - A City Group (the Oslo City Group)
 - An Inter Secretariat Working Group (InterEnerStat)

A few milestones in the development of the InterEnerStat work

2nd draft of the InterEnerStat website

OCG 3

1st draft of the InterEnerStat website

InterEnerStat 2
November 2007

OCG 1

Ad hoc Energy Group Meeting
UNSD, May 2005

InterEnerStat 1
November 2005

The 1st InterEnerStat Workshop

- **Date: 22-23 November 2005**
- **Place: International Energy Agency, Paris**
- **Participants: 24 major regional and international organisations. Both data providers (IEA, UNSD, OPEC, Eurostat, APEC, FAO) and users (IMF, UNFCCC,...)**
- **Objectives:**
 - ➔ **To hear from each organisation what they do, what are their problems and their expectation for more co-operation**
 - ➔ **To pave the way for more harmonisation and for strengthening bilateral and international co-operation**

Two Clear Requests

Harmonisation

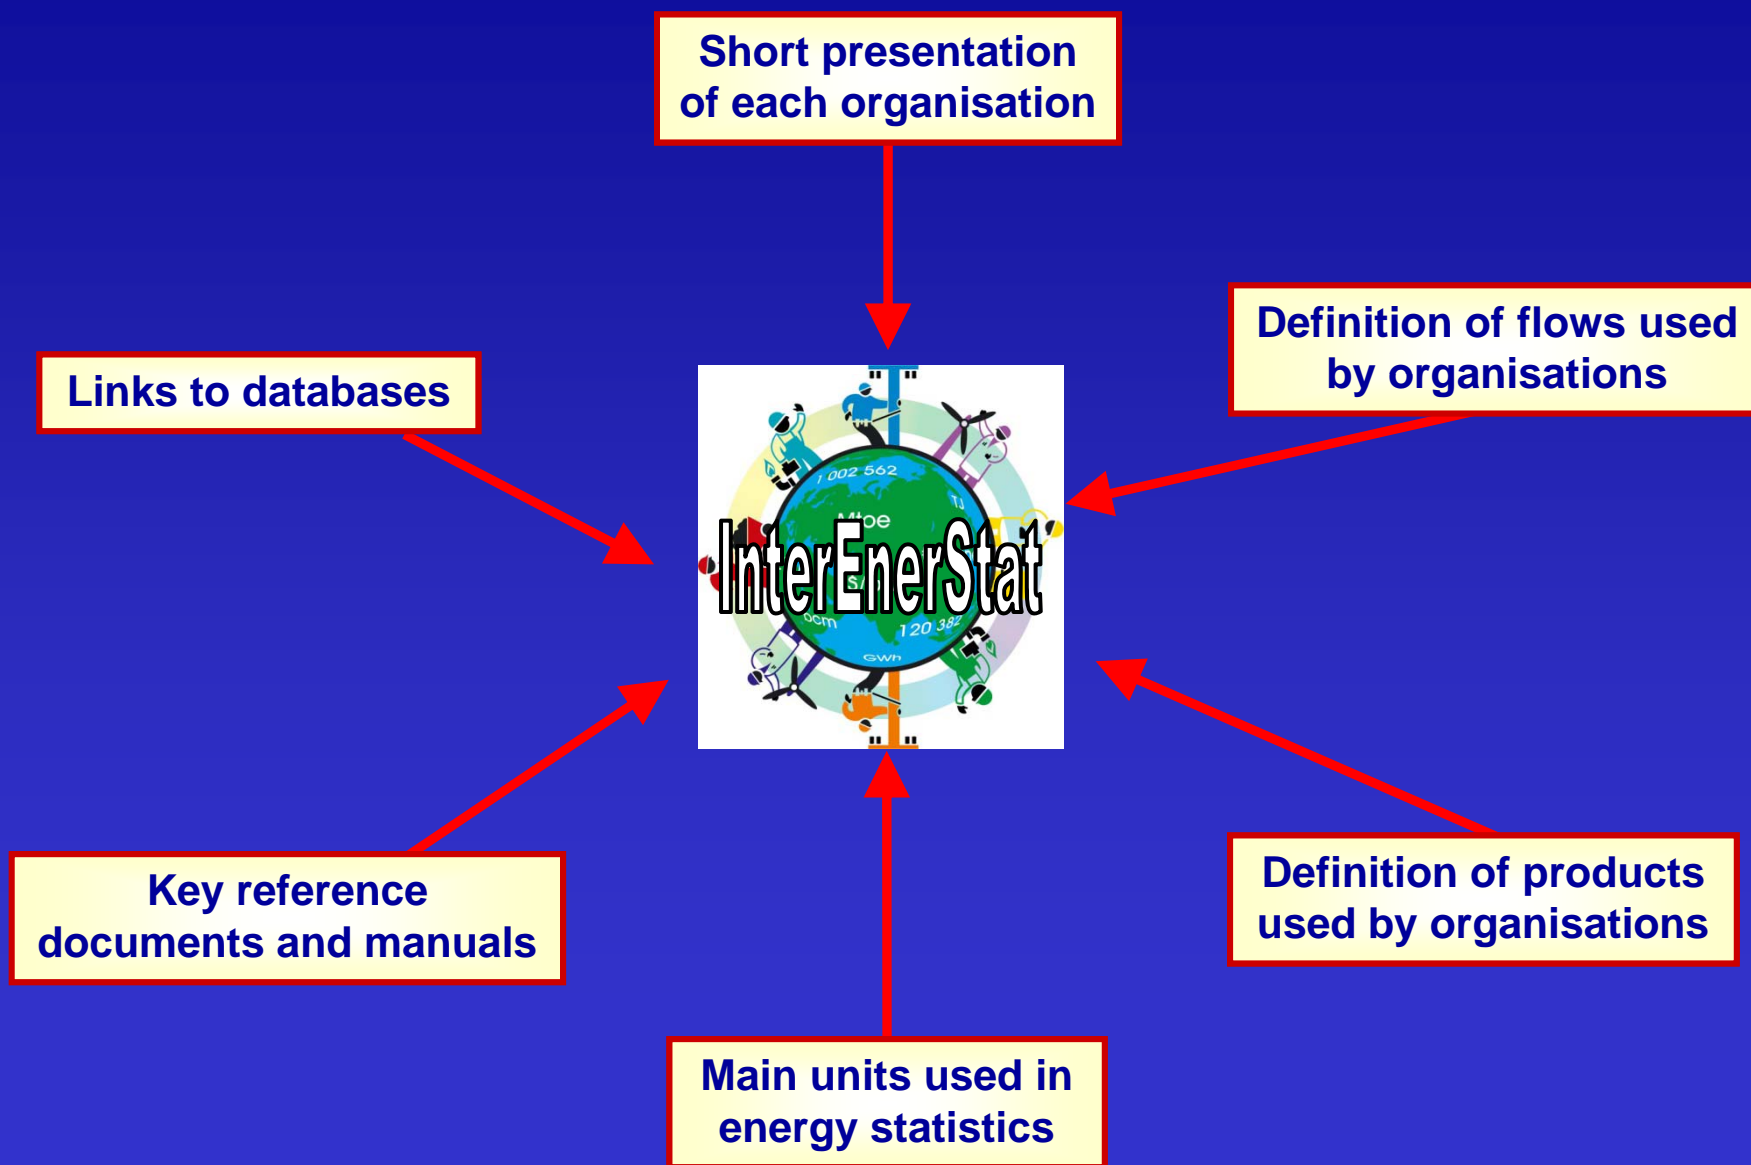

- Methodologies
- Definitions
- Units
- Conversion factors
- Harmonised demands and questionnaires
- Handbooks and manuals
- Training
- Quality framework

Co-operation

- 
- Raising political awareness
 - Harmonisation
 - Joint Questionnaires
 - Joint Training
 - Common manuals
 - Joint quality assessment
 - Exchange of data

Priority was to collecting basic information on each organisation in terms of statistics collecting and use

A Web site was prepared to display the information gathered

List of reference documents by category

Definitions of products and flows from all the organisations who have definitions

Menu driven

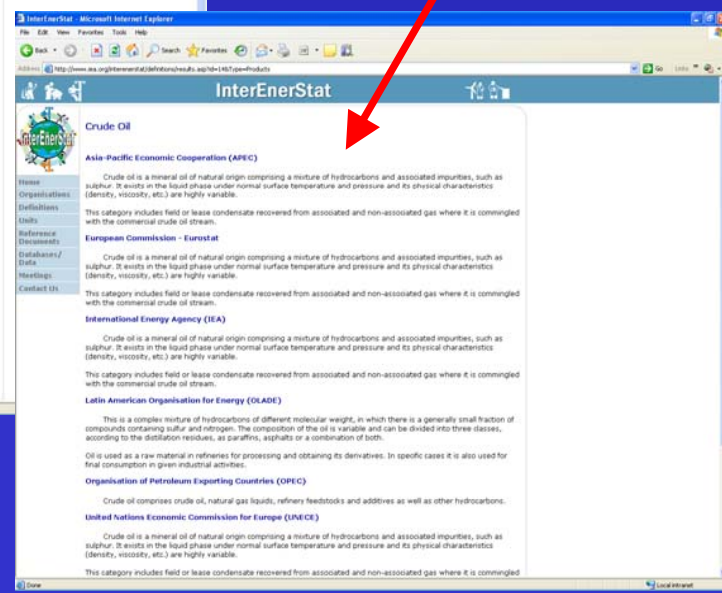

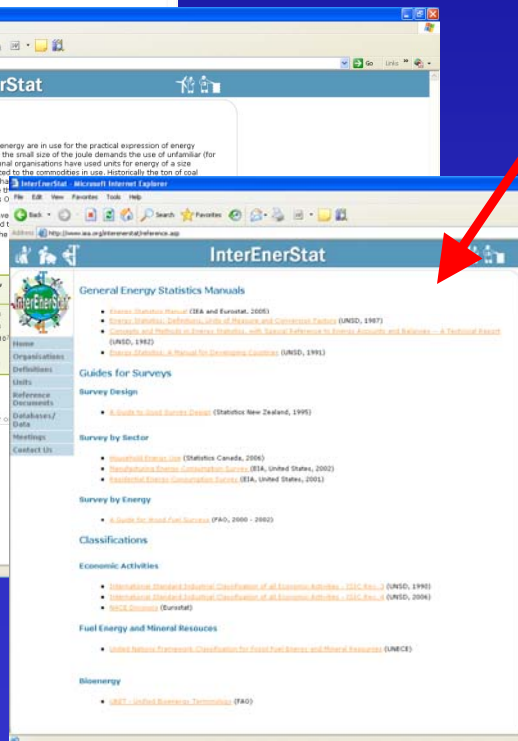

Main units used in energy conversion

The SI unit of energy is the joule (J). Many other units for energy are in use for the practical expression of energy quantities partly for historical reasons and partly because the small size of the joule demands the use of unfamiliar (for non-scientists) decimal prefixes. As a result, the international organisations have used units for energy of a size appropriate for expressing national fuel supplies and related to the commodities in use. Historically the ton of coal equivalent was used but, with the ascendance of oil, this has been replaced by the oil barrel. Many national balances use units with the recommendations by the International Standards Organisation.

There are several definitions of the calorie in use. The calorie is the International System Table (IT) value which is defined for the British thermal unit (Btu) is now 1 055 06 joules. The Btu is defined as 1 055 06 joules.

From:	To:	Multiple for:

Naphtha

Asia-Pacific Economic Cooperation (APEC)

Naphtha is a feedstock destined for either the petrochemical industry (e.g. ethylene manufacture or aromatics production). Naphtha comprises material in the 30oC and 210oC distillation range or part of this range.

European Commission - Eurostat

Naphtha is a feedstock destined for either the petrochemical industry (e.g. ethylene manufacture or aromatics production) or for gasoline production by reforming or isomerisation within the refinery. Naphtha comprises material in the 30oC and 210oC distillation range or part of this range.

International Energy Agency (IEA)

Naphtha is a feedstock destined for either the petrochemical industry (e.g. ethylene manufacture or aromatics production) or for gasoline production by reforming or isomerisation within the refinery. Naphtha comprises material in the 30oC and 210oC distillation range or part of this range.

Latin American Organisation for Energy (OLADE)

A volatile liquid obtained from processing oil and/or natural gas. Used as a raw material in refineries, as a solvent in manufacturing paints and varnishes, and as a cleansing agent. Also used in petrochemistry and the production of fertilizers.

United Nations Economic Commission for Europe (UNECE)

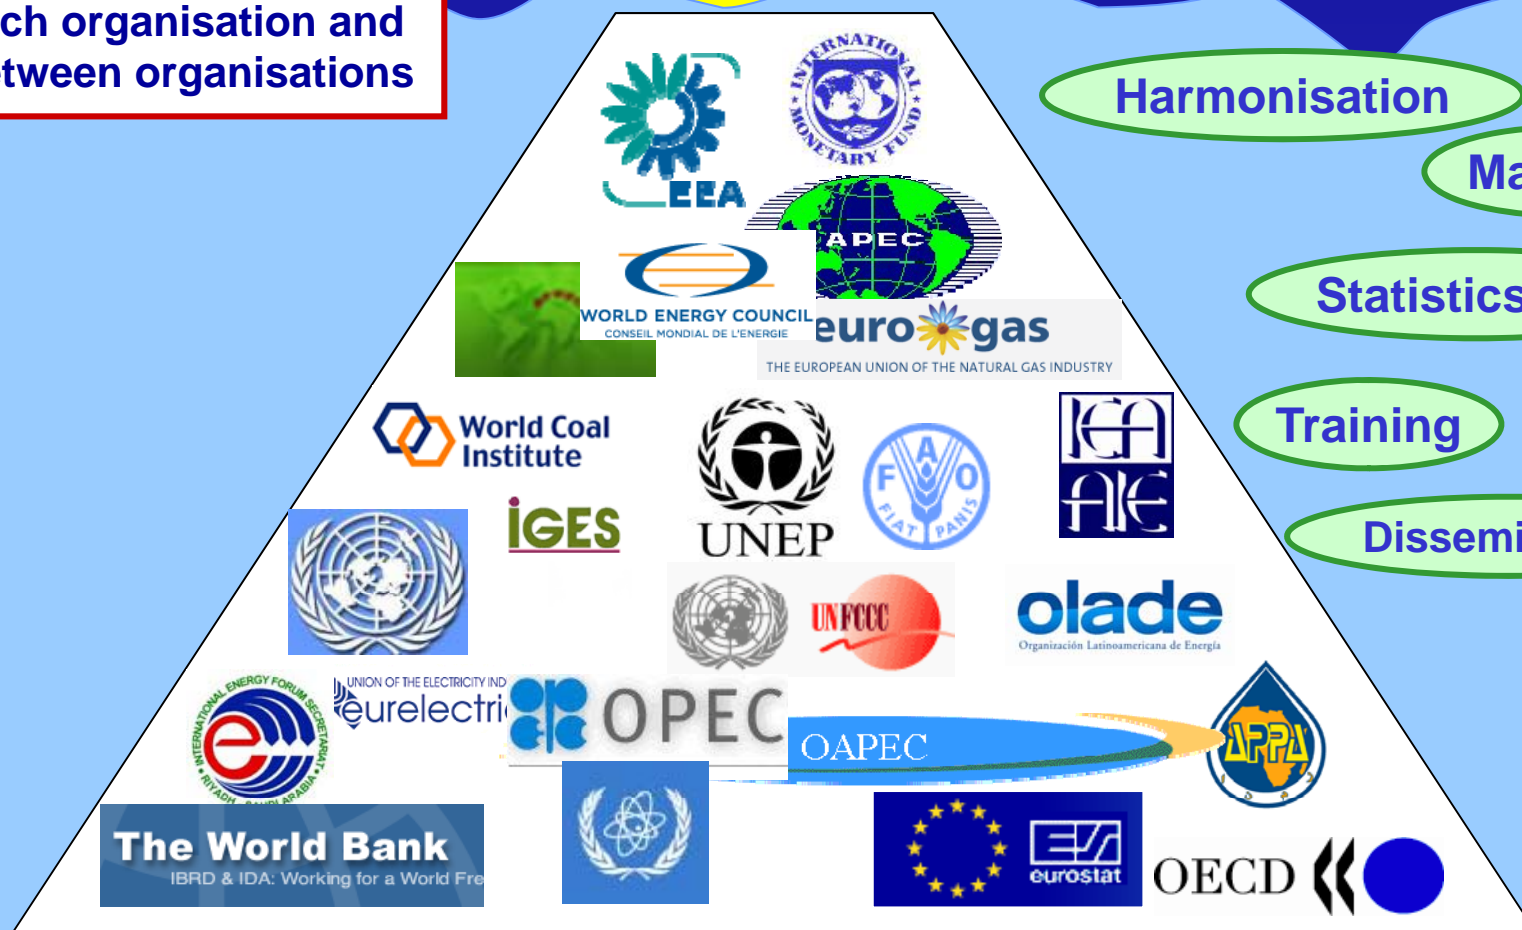

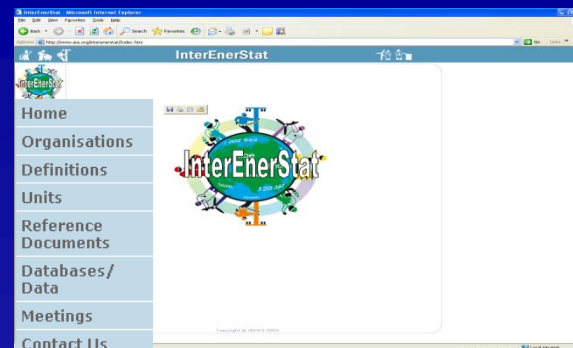

Naphtha is a feedstock destined for either the petrochemical industry (e.g. ethylene manufacture or aromatics production) or for gasoline production by reforming or isomerisation within the refinery. Naphtha comprises material in the 30oC and 210oC distillation range or part of this range.

Training

Dissemination

What happened since InterEnerStat 2

An expert has been contracted for:

- Looking at flows and products
- Highlighting similarities and differences
- Proposing a “compromise” definition for each flow/product

 **Comments have been sent by many organisations and assembled into two documents on flows and products**

InterEnerStat

Harmonisation of Definitions
of Energy Products and Flows

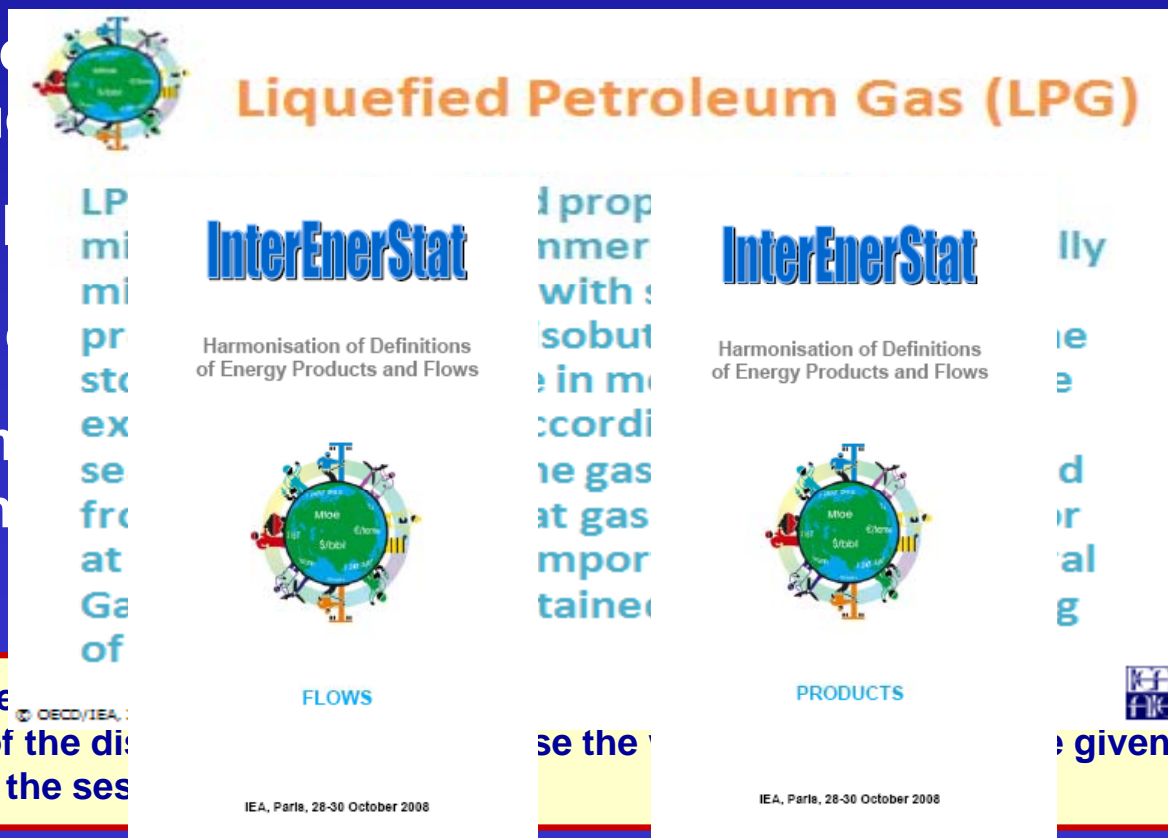

FLAWS

IEA, Paris, 28-30 October 2008

The Discussion Process

- 👉 The Chair to introduce the definition of a product or a flow
- 👉 The definition will be shown at the same time on the screen
- 👉 A paper will be distributed and the
- 👉 The Chair will
- 👉 Open
- 👉 Mr Simon will

Note: Two representatives of the main points of the discussion will be given to the participants after the session.

Participants will be asked to write down the main points of the discussion given to the

Comments received from organisations

Stocks are reserves of fuels held to maintain service under conditions where the supplies of fuel to the stock and/or deliveries from it are variable in their timing or amounts. Not all stocks are eligible for inclusion in fuel statistics and those which are need to be chosen in a manner consistent with the construction of the national fuel statistics.

Comment [4]:
Tim SIMMONS 6 August 2008 09:42
I think that we should say what stocks are as it provides an introduction to explaining which stocks are excluded (for example, pipeline stocks) and the importance of defining precisely the national scope of stocks.

APEC

Stock and Stock Changes – We agree with the consultant to identify which stocks are included and excluded. Only the stocks of the government, stock holding companies and bulk suppliers (importers, exporters, refineries and depots) should be included in stocks as stocks of consumers may be difficult to collect.

The word “reserves” to refer to stocks might also lead to confusion with reserves that are yet to be extracted from underground. Please find another word like inventory or the like.

IEA

We agree that we need to have a definition of stocks, but find the current suggestion to be vague. We should say what is and is not included.

The second part of the definition depends on the reporting convention. For oil, for example, the opposite of what is mentioned is usually the convention i.e. the stock change= closing-opening stocks.

Stocks and reserves should not be confused. Reserves we use for what is still underground.

OLADE

It would be useful to include formula for stock changes.

OPEC

We would agree to provide the explanation as to which stocks are excluded and the importance of stocks.

UNSD

The wording of the proposed definition seems to suggest that underground resources are included in the definition of stocks: the term "reserve" is generally used to denote a subset (which are exploitable under certain circumstances) of the natural underground resources.

OSLO CITY GROUP

Introduction

We much welcome the InterEnerStat initiative to harmonise definitions which we recognize is an important and challenging task.

We understand that the definitions are provided by the organisations and that the aim has been to harmonise these definitions to the extent possible, and recognize the work done by Mr Simmons by putting these draft definitions up for discussion. We see this as a unique possibility for energy statistics to have a set of clear and consistent definitions. We express our hopes that the work of InterEnerStat and Mr. Simmons will lead to an agreement on definitions, and ascertain our willingness to contribute in such a way that this will be possible.

We have taken your request for comments seriously. As a first approach to comment on the definitions as provided by Mr Simmons we contacted several data providers and users of energy statistics in Norway for their comments. In the next step we had internal discussion on the different groups of commodities and debated how we should take into account the different views we received. Finally we came to some conclusions and questions that we would now like to forward to you as a response to your request for comments.

Principles for definitions – criteria for the definition of products

We completely agree with Mr. Simmons that definitions should be as simple as possible and limited to describing what the product is. With this we understand a description based on the physical and chemical properties of the products. We also agree that notes on reporting of quantities, classification of products, production and consumption processes should not be included in the definitions. We believe that by making simple definitions based on physical and chemical properties independent of classification it will be easier to come to an agreement on product definitions.

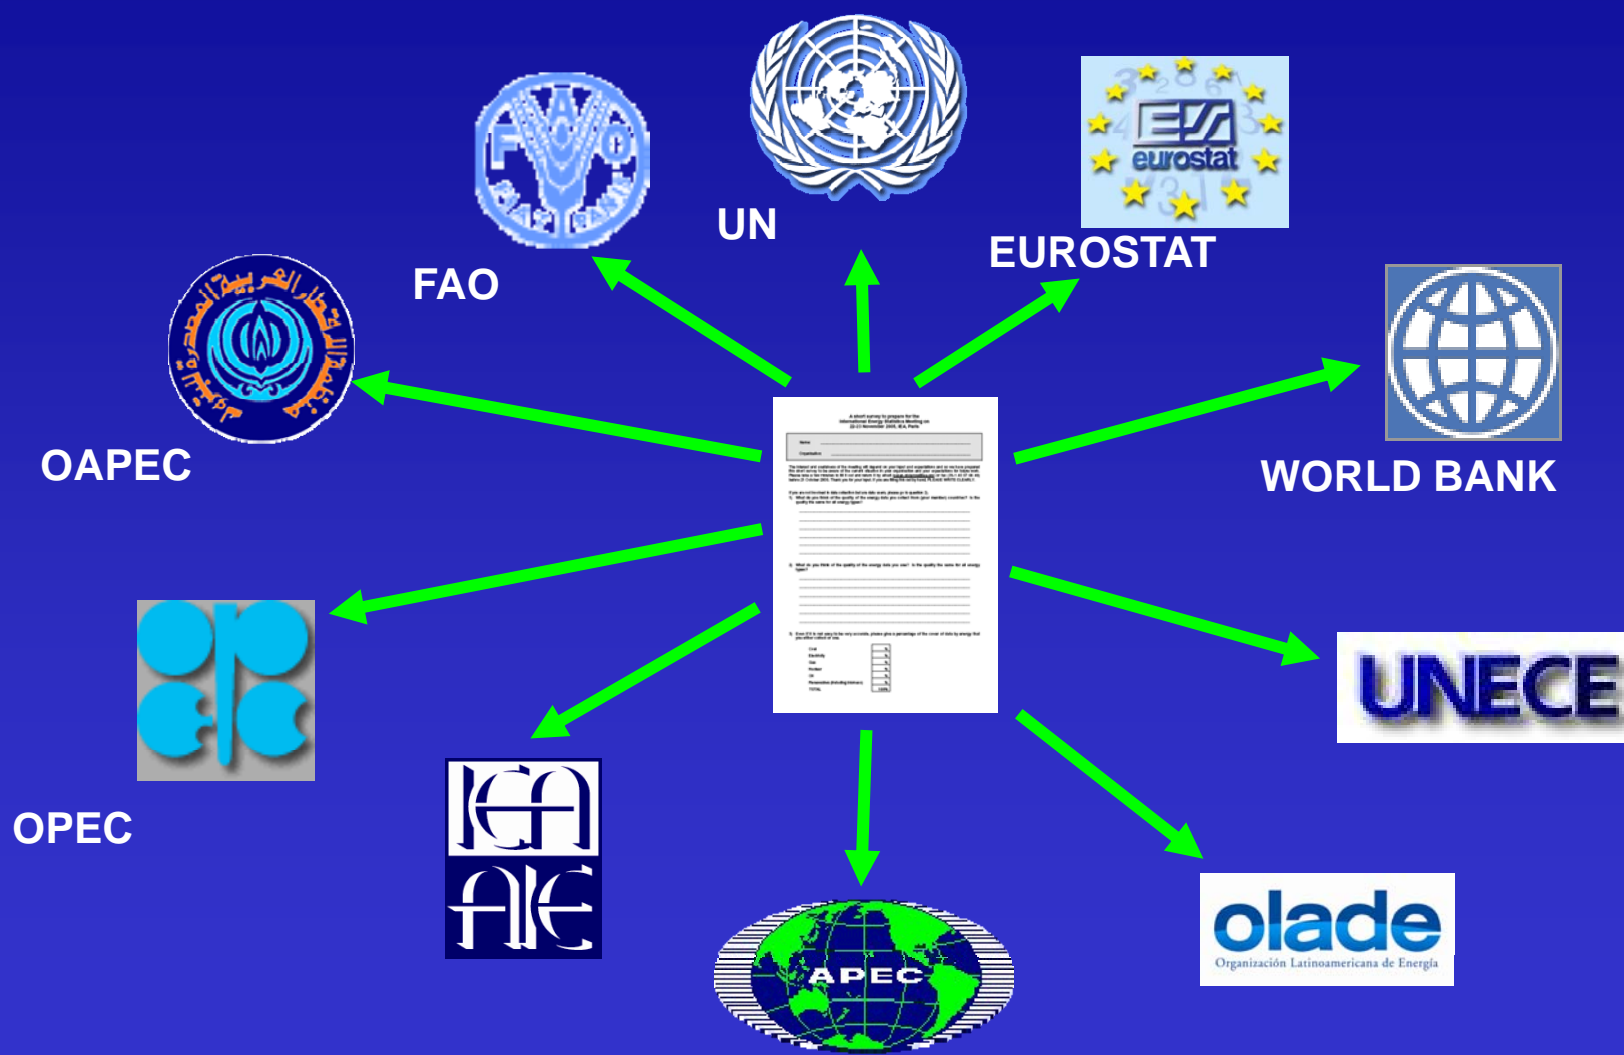

As we see it many of the products are not defined according to these principles and may need some elaboration. We have received many comments addressing the lack of consistency between the proposed definition and the criteria for the definition of products.

In energy statistics energy is traditionally classified into primary and secondary energy sources/commodities. Other classification schemes might be equally important. Energy sources and commodities can also be classified according to the state in which they are extracted, traded or consumed, gas, liquid or solid. Oil and gas are for instance in gaseous and liquid phases, while coal, coke and peat are in a solid phase (therefore solids, short for solid fossil fuels?). Recently, our awareness of climate changes and the importance of emission of carbon to the atmosphere have made us ask for more and better statistics on renewable energy. Therefore, energy sources are also classified in renewable and non-renewable energy sources. Energy sources can be renewable, fuels can not. We think that it is unfortunate to group side by side classes of energy sources and commodities like "oil and gas" on one hand and "renewables" on the other, as the word renewable belongs to a classification scheme.

A few pages of
general
comments

Two documents (flows and products) sent to organisations

Harmonisation: The first step was to collect from each organisation its own set of definitions

The 2nd step was to assemble them in a transparent way easy to access
