Air Quality and Multimedia Sciences

Fifth Annual EPRI-IEA Challenges in Electricity Decarbonisation
Expert Workshop
Paris, France
November 7, 2018

Air Pollution Challenges Around the World

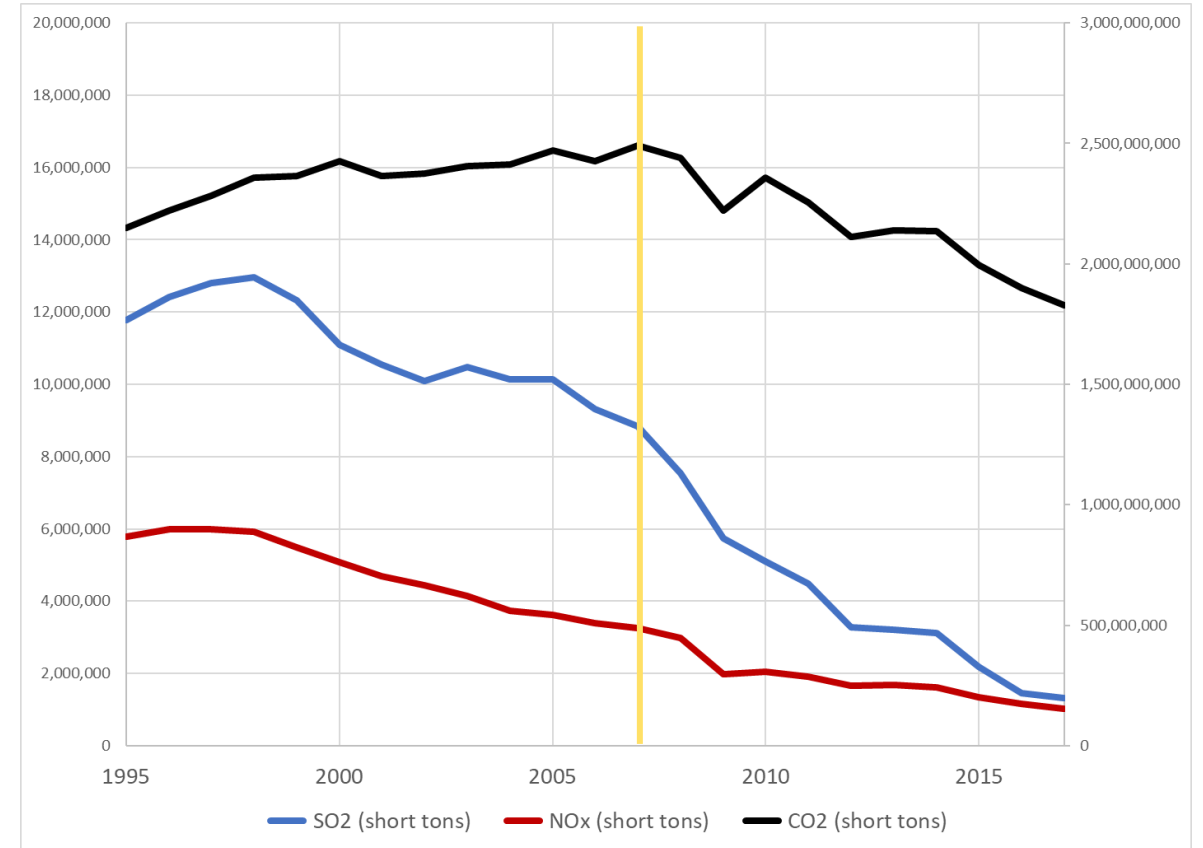

Overview

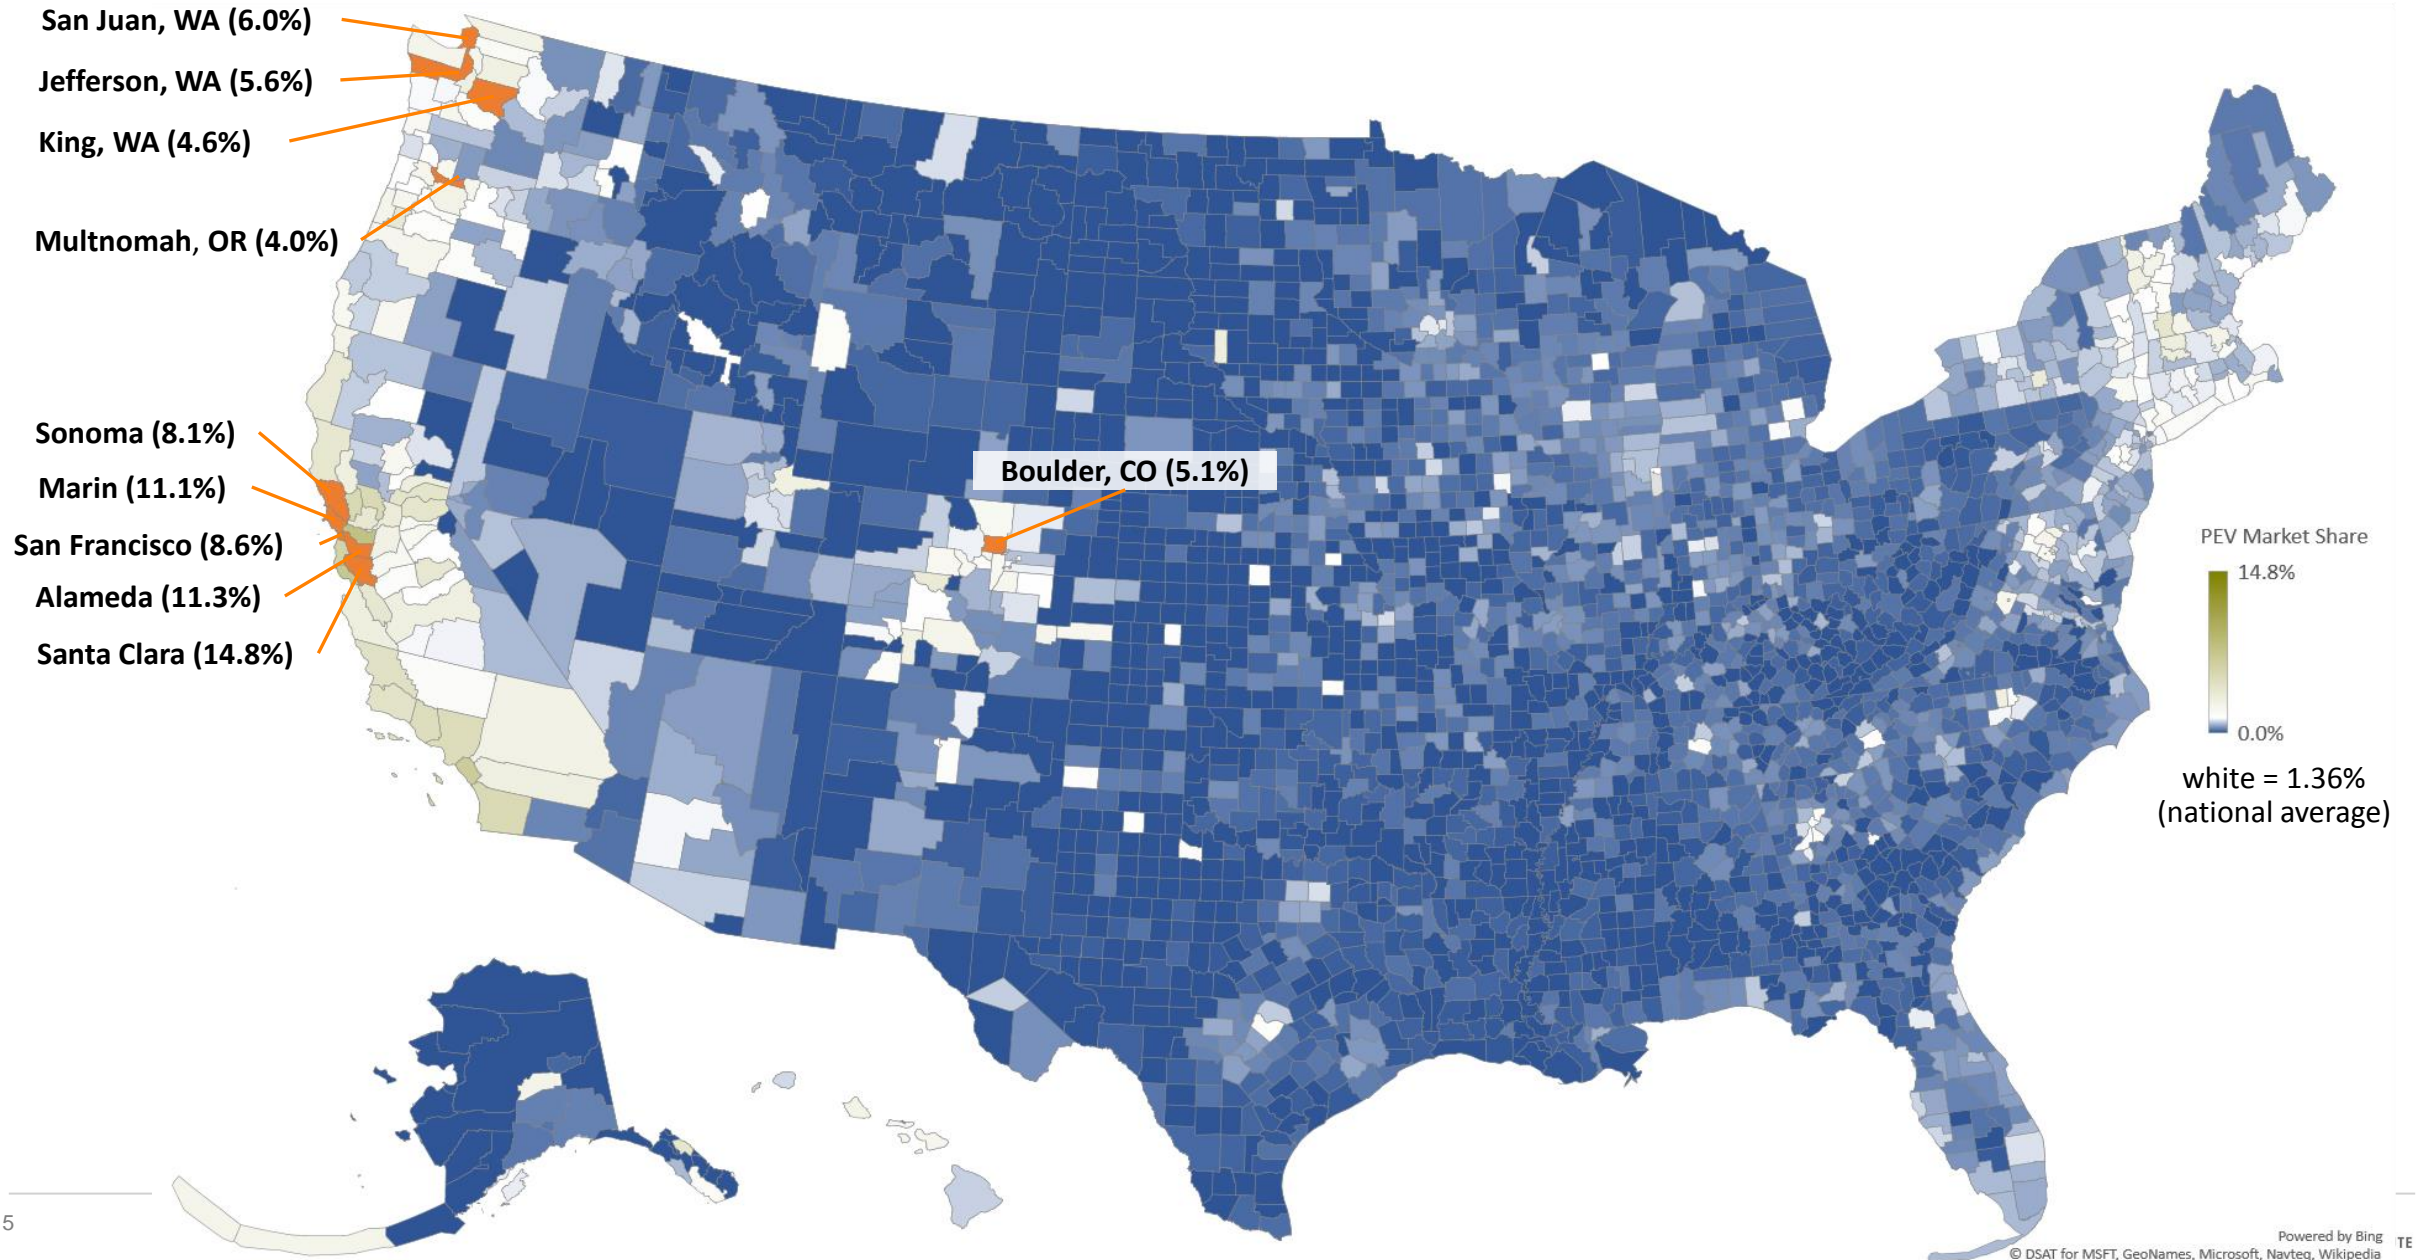

- This presentation focuses on two electrification studies:
 - EPRI-NRDC 2015 study on the air quality and greenhouse impacts of electric transportation
 - Air quality analysis focused on a scenario of potential transportation electrification projection to 2030
 - California Energy Commission (CEC) study:
 - Air quality impacts estimated from a scenario of aggressive electrification of all amenable end-use sectors projected to 2050 (preliminary results)
 - Not a policy-driven scenario; technological potential based on aggressive assumptions

Generation and Emissions Trends in the Electric Power Industry: 1995-2017

Currently: 97 counties in 16 states have > 2.0% EV sales (through June 2018)

EPRI-NRDC 2015 Study: Near-term (2030) Impacts of Transportation Electrification

EPRI-NRDC Study: Percent Electric Vehicle Miles Traveled by 2030

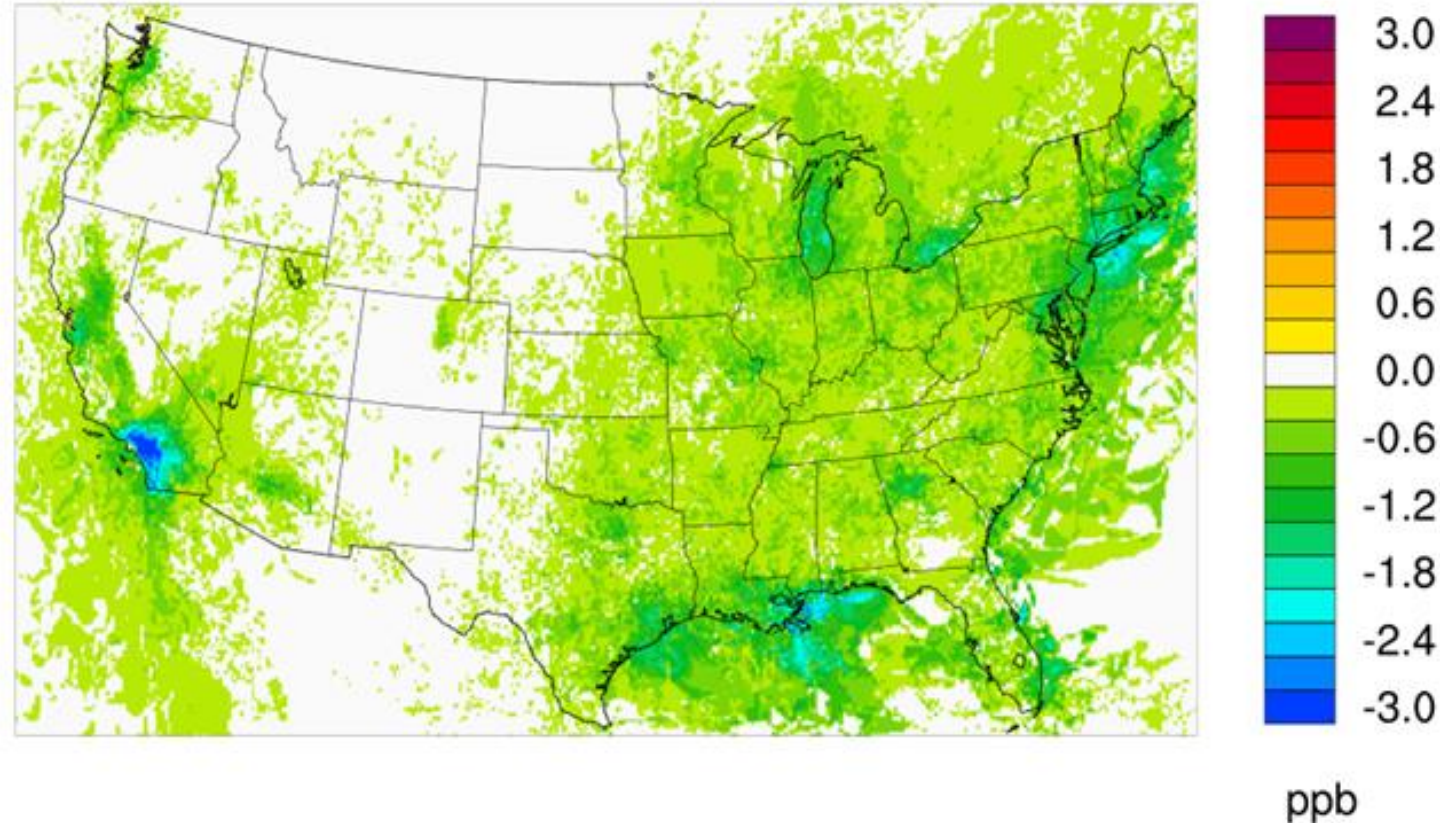

EPRI-NRDC Study: Examples of Electrified Non-Road Equipment

Lawn and Garden	
Chain Saws (units ≤ 6 horsepower)	Push Lawn Mowers
Chippers/Shredders (units ≤ 6 horsepower)	Riding Lawn Mowers (units ≤ 40 horsepower)
Commercial Turf Equipment (units ≤ 25 horsepower)	Snow Blowers (units ≤ 3 horsepower)
Leaf Blowers	Trimmers/Edgers
Industrial	
Agricultural Pumps	Port Cranes
Aircraft Auxiliary Power Units	Shoreside Power
Airport GSE (units ≤ 175 horsepower)	Sweepers / Scrubbers (units ≤ 25 horsepower)
Dredging Craft	Switching Locomotives
Forklifts (units ≤ 175 horsepower)	Transportation Refrigeration Units
Recreational	
ATVs	Motorcycles
Golf Carts	Special Vehicle Carts (units ≤ 25 horsepower)

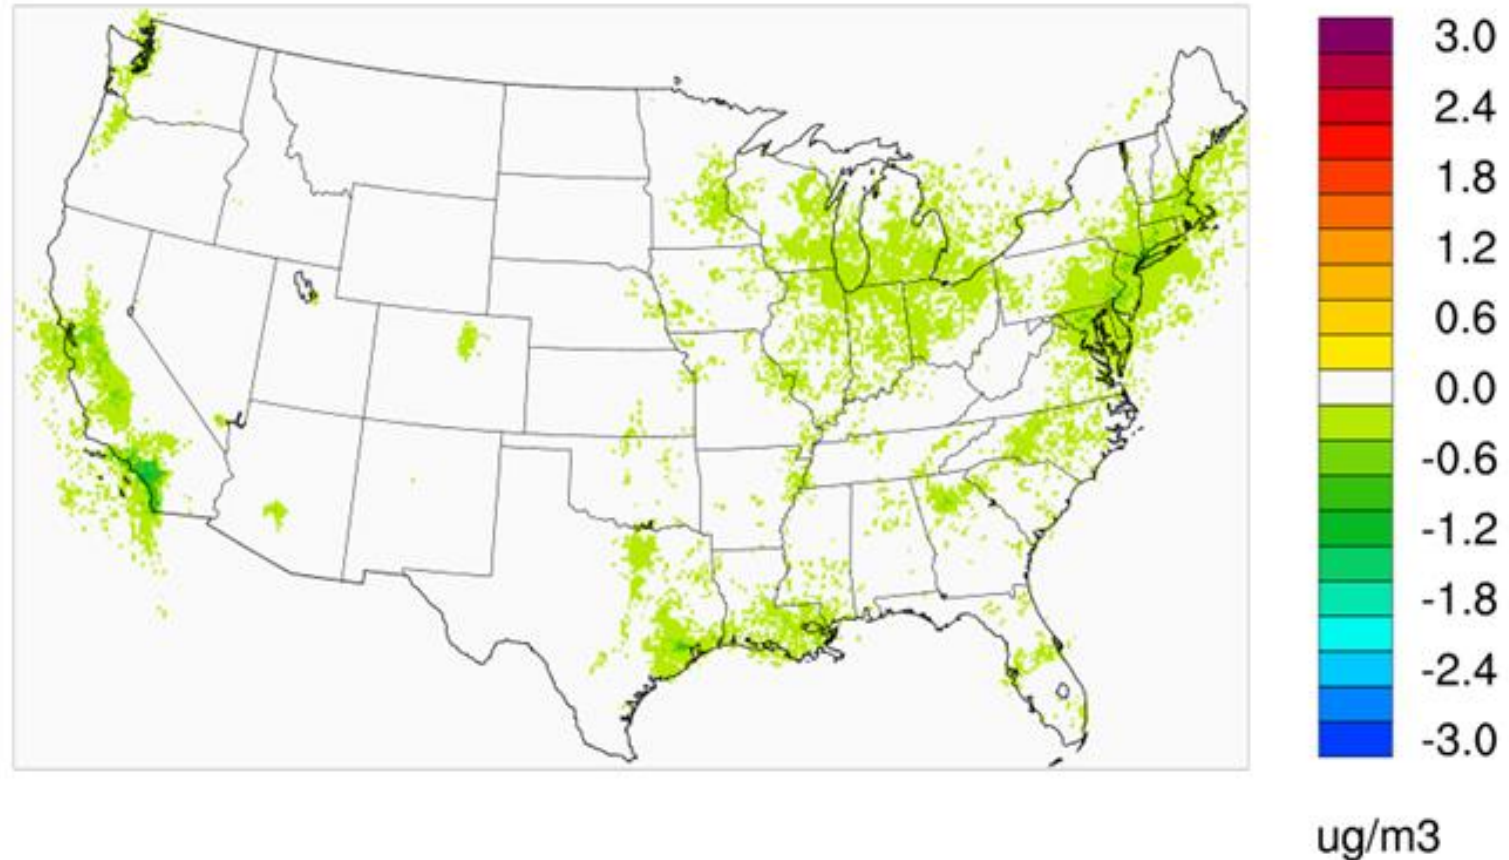

**Only electrified the “low-hanging fruit”
technologies already “primed” for electrification**

EPRI-NRDC Study: Ozone Impacts in 2030

- There are modest, but widespread air quality benefits, i.e. reduced ozone concentrations
- ~1 ppb benefits are widespread and benefits are higher in urban areas

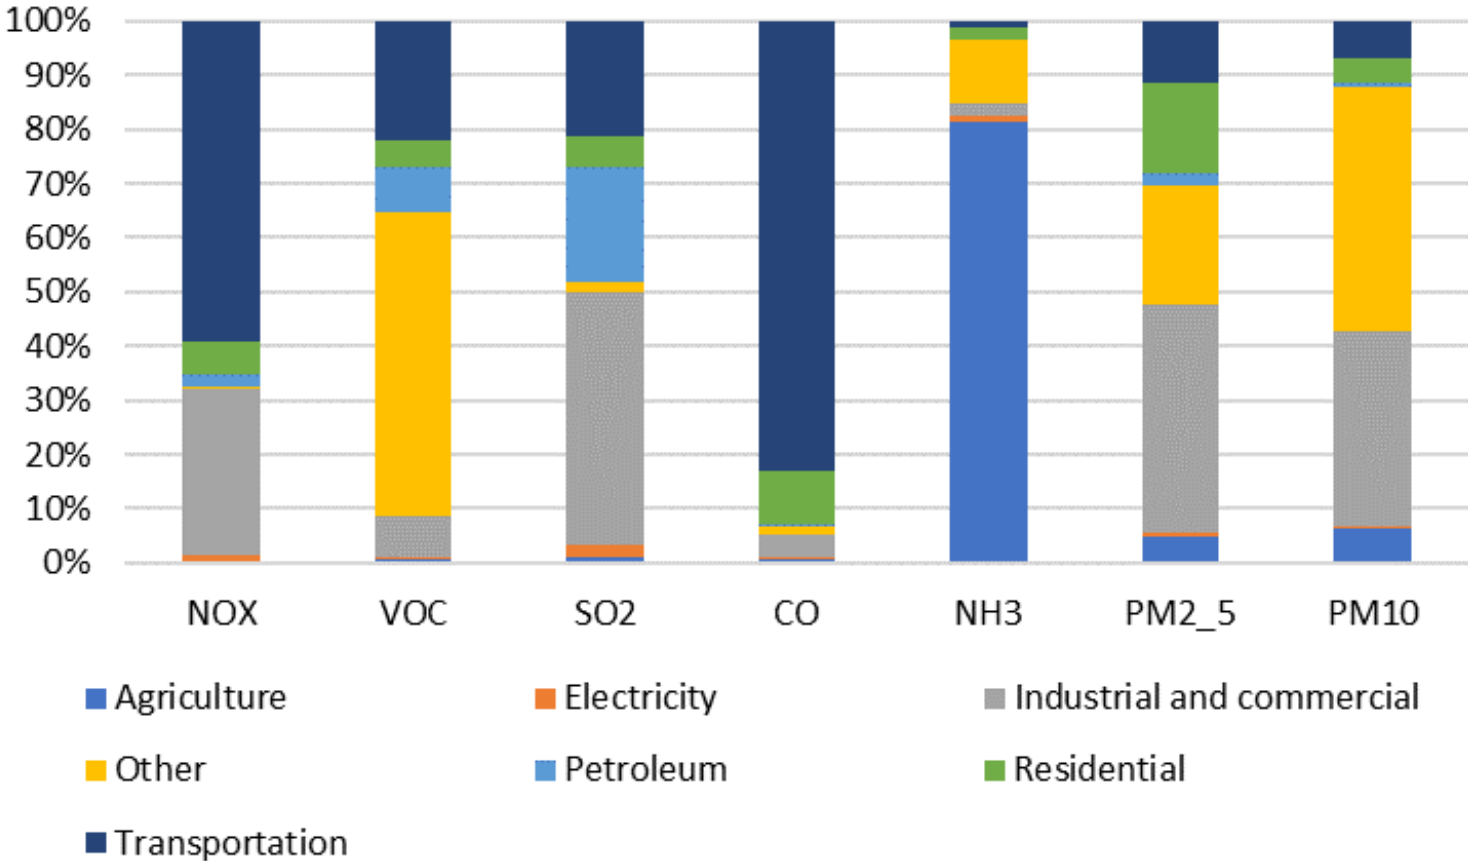

EPRI-NRDC Study: Fine Particulate Matter (PM_{2.5}) results

- There are also reductions in fine particulate matter, PM_{2.5}, mostly concentrated in urban areas

Aggressive Economy-wide Electrification in 2050
California Case Study
(supported by California Energy Commission)

Emissions Inventory: Reference (Overall)

Emissions Inventory: Electrification Scenario

Electrification Assumptions 2050 (On-Road)

Fuel use category	Electrification share	Source
combination long-haul	80%	LTES heavy duty adoption
combination short-haul	80%	LTES heavy duty adoption
intercity bus	88%	LTES bus adoption
light commercial truck	85%	TAC suggestion
motor home	80%	LTES heavy duty adoption
motorcycle	93%	LTES light duty adoption
passenger car	93%	LTES light duty adoption
passenger truck	93%	LTES light duty adoption
transit bus	88%	LTES bus adoption
refuse truck	80%	LTES heavy duty adoption
school bus	88%	LTES bus adoption
single unit long-haul	66%	LTES medium duty adoption
single unit short-haul	66%	LTES medium duty adoption

LTES - “Long-Term Energy Scenarios In California” performed by Energy and Environmental Economics (E3) for CEC (project EPC-14-069).

Electrification Assumptions 2050 (Non-Road)

Fuel use category	Electrification share	Source
agricultural	15%	TAC suggestion
aviation	10%	TAC suggestion
construction and mining	0%	
forklift	100%	Assume aggressive adoption
ground support equipment	100%	Assume aggressive adoption
lawn and garden	100%	Assume aggressive adoption
marine	10%	TAC suggestion
marine (port)	100%	Assume aggressive adoption
other non-road	0%	
rail	0%	
rail (yard)	100%	Assume aggressive adoption
recreational equipment	0%	
recreational marine	25%	TAC suggestion
refrigeration	100%	Assume aggressive adoption
terminal tractor	100%	Assume aggressive adoption
truck apu	100%	Assume aggressive adoption

Electrification Assumptions 2050 (Various Sectors)

Sector	Fuel use category	Electrification share	Source
Industrial	boiler	98%	LTES commercial water heating adoption
Industrial	chemical manufacturing	0%	No electrification assumed
Industrial	heat	60%	EPRI assumption
Industrial	motion	100%	Very high adoption assumed
Industrial	other	0%	No electrification assumed
Industrial	solvents	0%	No electrification assumed
Industrial	space heat	80%	LTES commercial space heating adoption
Petroleum	boiler	90%	Petroleum use reduction
Petroleum	heat	90%	Petroleum use reduction
Petroleum	other	90%	Petroleum use reduction
Residential	heating	99%	LTES residential water heating adoption
Residential	space heating	83%	LTES residential space heating adoption
Residential	wood heating	100%	Complete replacement of wood heating assumed

Preliminary CEC Study Air Quality Impacts: July 2050

Maximum daily 8-hour average (MDA8) ozone
24-hour average fine particulate matter (PM_{2.5})

July 2050 Maximum MDA8 Ozone in South Coast Air Basin

- Broad reductions maximum daily average 8-hour ozone (July 2050) within 10-20 ppb
- Up to 33 ppb reduction; small area of NOx disbenefit generally within 1-3 ppb (up to 14 ppb increase near Long Beach) in region with low baseline ozone

Reference

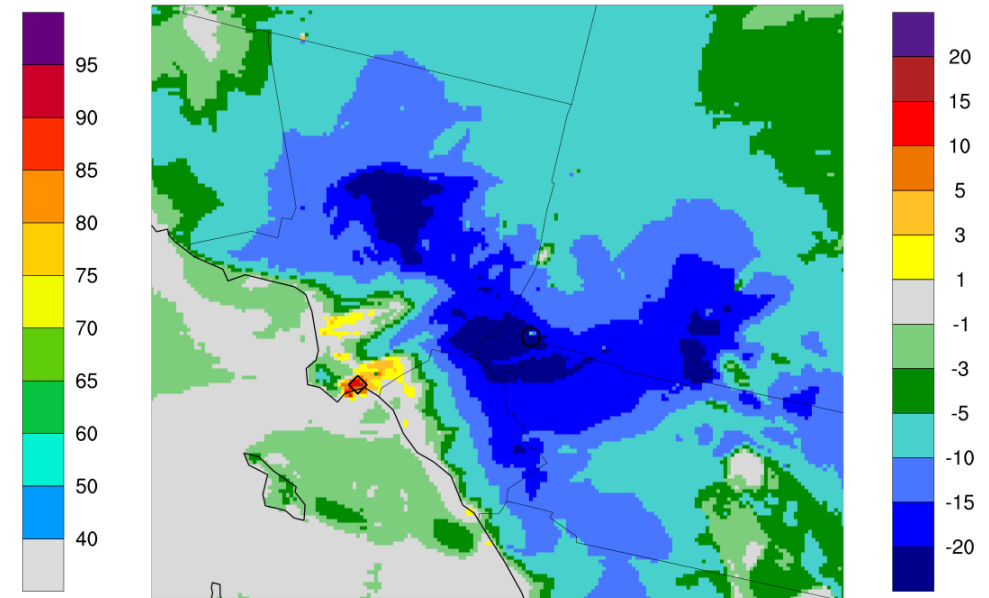

◇ max(74,92) = 103.3 ppb
○ min(48,76) = 4.8 ppb

Electrification

◇ max(122,77) = 86.2 ppb
○ min(48,76) = 5.3 ppb

Elec - Ref

◇ max(57,59) = 16.2 ppb
○ min(104,72) = -33.3 ppb

July 2050: Maximum 24-hr PM_{2.5} in South Coast Air Basin

- Broad reductions within 1-5 $\mu\text{g}/\text{m}^3$
- Maximum reduction of 15 $\mu\text{g}/\text{m}^3$ near Long Beach; large reductions in elemental carbon and primary organic aerosol as well as other PM_{2.5} constituents

Reference

◇ max(56,63) = 71.5 $\mu\text{g}/\text{m}^3$
○ min(12,156) = 2.0 $\mu\text{g}/\text{m}^3$

Electrification

◇ max(56,63) = 58.7 $\mu\text{g}/\text{m}^3$
○ min(12,155) = 1.8 $\mu\text{g}/\text{m}^3$

Elec - Ref

◇ max(115,153) = 12.2 $\mu\text{g}/\text{m}^3$
○ min(51,67) = -15.3 $\mu\text{g}/\text{m}^3$

Conclusions

- Electric sector emissions in the US have decreased significantly due to shifts in generation and a myriad of air quality regulations
- The EPRI-NRDC study shows that, in the near term, transportation electrification can lead to modest but widespread air quality benefits in the United States
- Preliminary results (limited to July 2050) from a study supported by the California Energy Commission demonstrates that aggressive electrification combined with low-emissions electric generation can lead to even greater air quality benefits even taking into account improvements in combustion technologies
- The impact of electrification to indoor and outdoor air quality would vary in different regions of the world, but these analysis illustrate the potential for substantial improvements in pollutant exposure

Together...Shaping the Future of Electricity
