

# Solar energy perspectives

Cedric Philibert, Renewable Energy Division

*RSA, 5 July 2011*

iea

# Contents

- **Renewables as seen by the IEA**
- **Solar electricity roadmaps**
- **Grid integration of variable renewables**
- **The PV boom and related policy issues**

# Growing shares of renewables in all sectors, for all scenarios

*All scenarios point out a large growth of renewables*

# The 450 Scenario: *How do we get there now?*

## World energy-related CO<sub>2</sub> emission savings by country in the 450 Scenario relative to the Current Policies Scenario

### Share of cumulative abatement between 2010-2035

|            |     |
|------------|-----|
| Efficiency | 53% |
| Renewables | 21% |
| Biofuels   | 3%  |
| Nuclear    | 9%  |
| CCS        | 15% |

***Renewables are the second most important contributors to CO<sub>2</sub> emissions reduction***

# The primary role of renewables in the BLUE scenarios

**Renewables provide from almost half to three quarters of the global electricity mix in 2050**

# Growth of renewable power generation in the BLUE Map

Electricity generation from RE grows strongly. Wind, hydropower and solar provide the bulk of it.

# RE generation in 2050 for key countries/regions

**The mix varies according to resources**

# IEA Solar Technology Roadmaps

## Technology Roadmap

Solar photovoltaic energy

## Technology Roadmap

Concentrating Solar Power

# PV & CSP technology roadmaps

- **Launched by IEA's Executive Director Nobuo Tanaka in Valencia, 11 May 2010 (MSP Conf.)**
- **PV and CSP complementary to each other**
- **Solar electricity could represent up to 20% to 25% of global electricity production by 2050**
  - **Roughly half CSP, half PV**
  - **Producing up to 9000 TWh per year**
  - **Saving almost 6 billion tonnes CO<sub>2</sub> per year**
- **This decade crucial for effective policies to enable the development of solar electricity**
- **Need to plan and invest in grid infrastructure**

# PV & CSP complementarities

- PV takes **all** light
- PV almost **everywhere**
- Mostly at **end-users'**
- **Variable**
- Peak & mid-peak
- Grid parity (retail) **by 2020**
- CSP takes **direct** light
- CSP **semi-arid** countries
- Mostly for **utilities**
- **Firm**, dispatchable } backup storage
- Peak to **base-load** }
- Competitive peak power **by 2020**
- **HVDC** lines for transport

***Firm & flexible CSP capacities can help integrate more PV***

| <div>Focus type</div> <div>Receiver type</div> | <b>Line focus</b><br>Collectors track the sun along a single axis and focus irradiance on a linear receiver. This makes tracking the sun simpler. | <b>Point focus</b><br>Collectors track the sun along two axes and focus irradiance at a single point receiver. This allows for higher temperatures. |
|--|---|---|
|--|---|---|

**Fixed**

Fixed receivers are stationary devices that remain independent of the plant's focusing device. This eases the transport of collected heat to the power block.

Linear Fresnel reflector (IFR)

**Mobile**

Mobile receivers move together with the focusing device. In both line focus and point focus designs, mobile receivers collect more energy.

# Uses of storage

## Mid load

## Delayed mid load

# Uses of storage

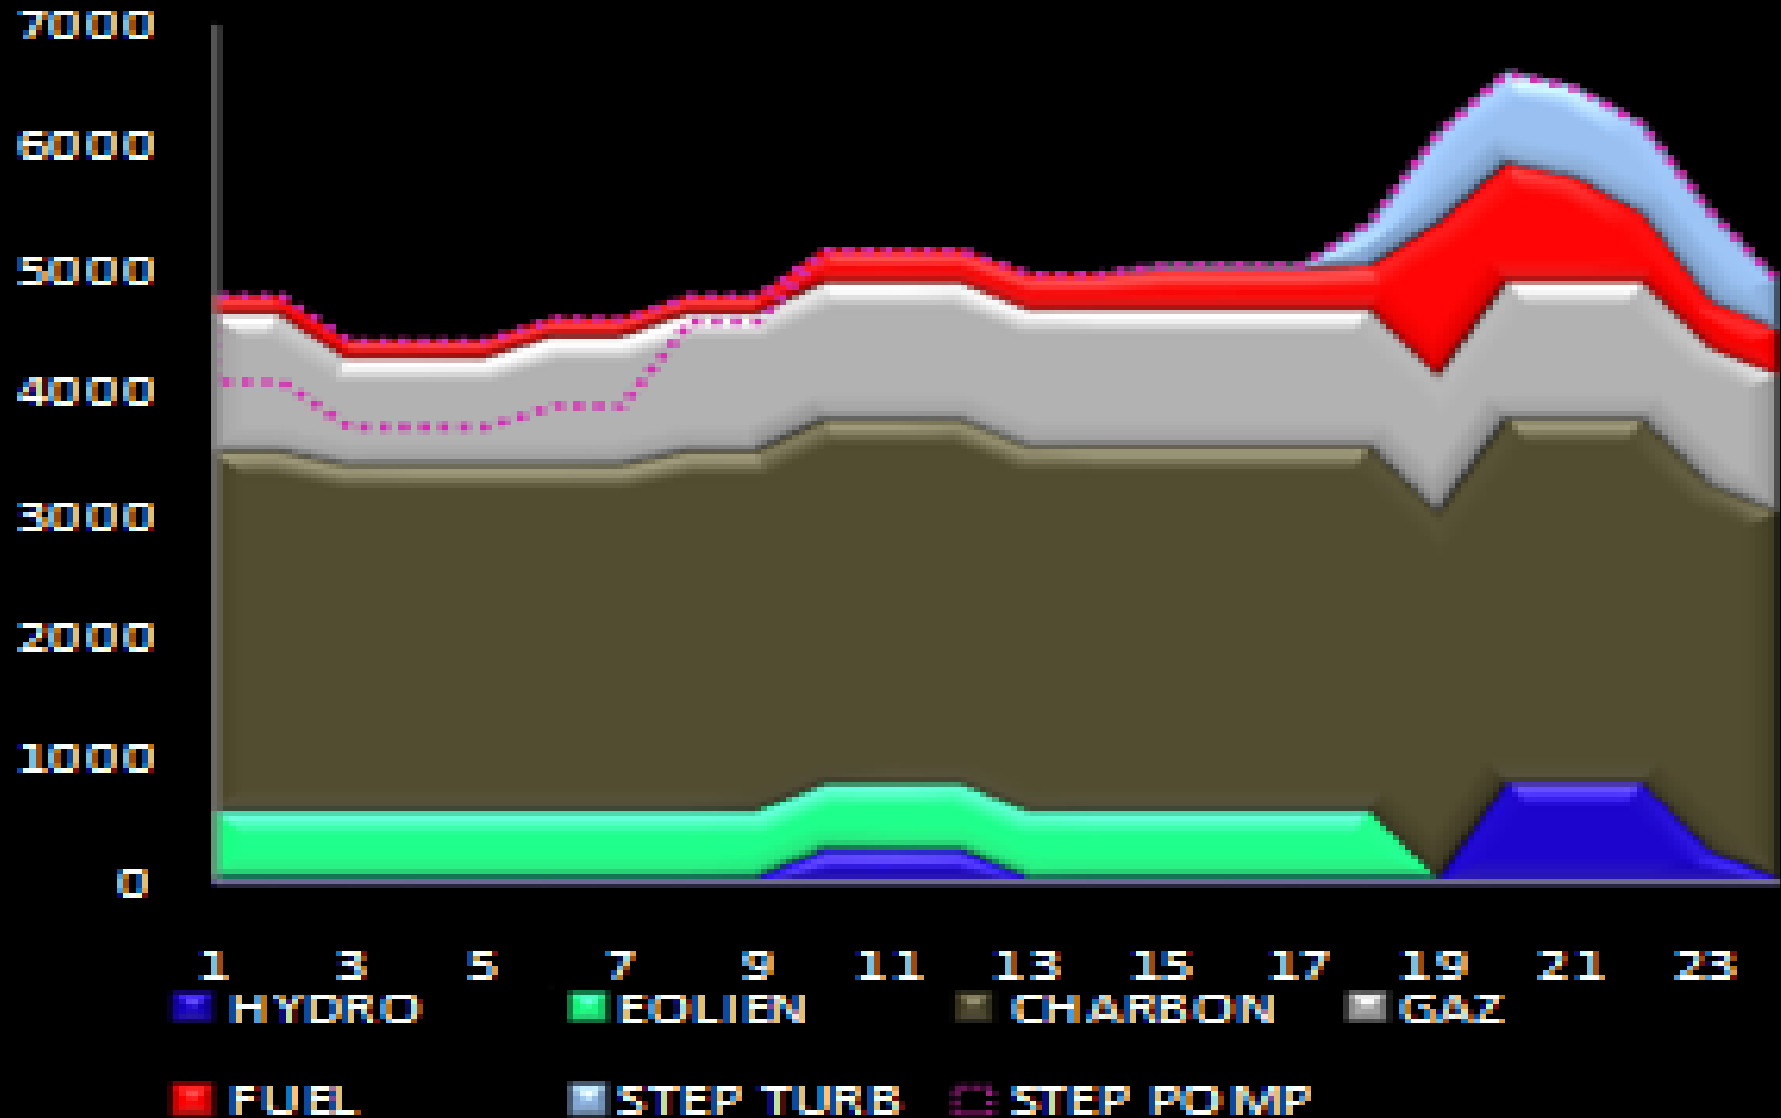

Base load

peak load

# Morocco 2017: load curve & merit order

# Morocco 2017: load curve & merit order with PV

# Morocco 2017: load curve & merit order w. CSP

# Temperatures and storage costs

$$\text{Stored Heat} = \sum mCp \Delta T$$

Stored Heat is Proportional to  $\Delta T$

Large / Smaller  $\Delta T \approx 278^\circ\text{C} / 90^\circ\text{C}$

Low Temperature Storage Requires  $\approx 3\times$  mass

Troughs

Tower

Low Temperature Storage  $\sim 3\times$  Cost per MWt

$\sim 378^\circ\text{C}$

$288^\circ\text{C}$

$566^\circ\text{C}$

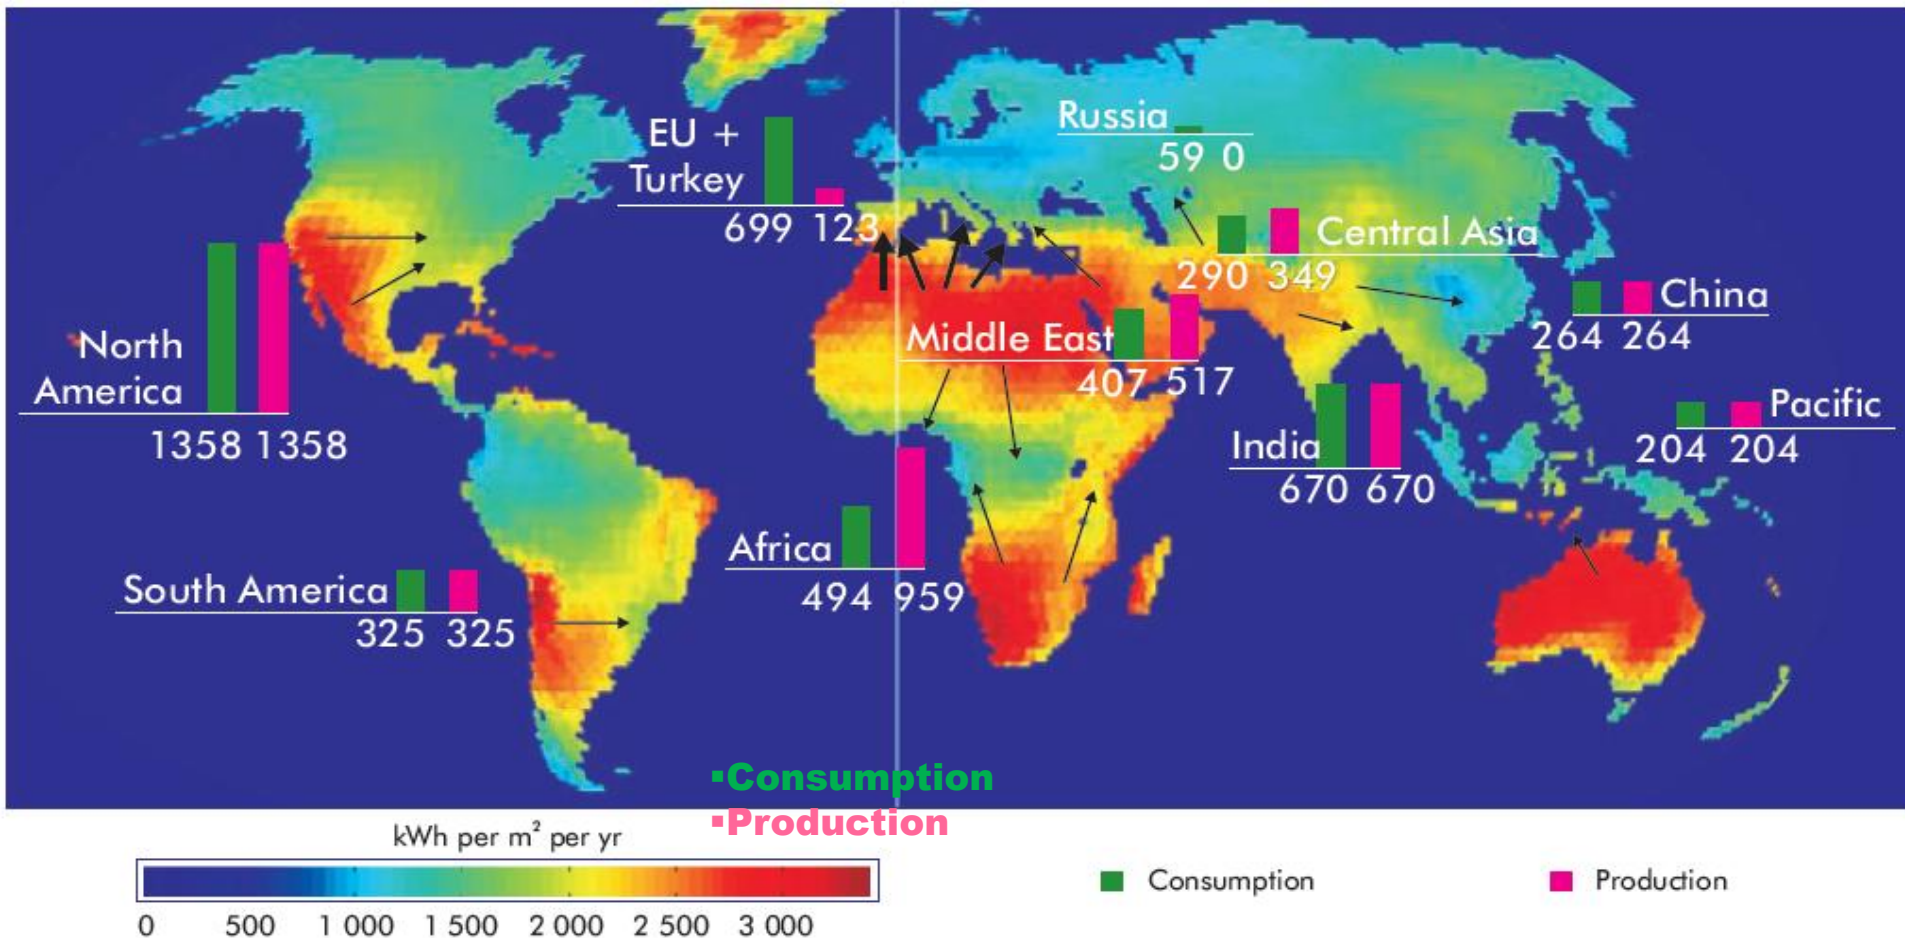

$288^\circ\text{C}$

# CSP costs and global output

DNI = direct normal irradiance

# The CSP Roadmap: 2050

Repartition of the solar resource for CSP plants in kWh/m²/y, and of the production and consumption of CSP electricity (in TWh) by world region in 2050 as foreseen in this roadmap. Arrows represent transfers of CSP electricity from sunniest regions or countries to large electricity demand centres.

Sources: Breyer & Knies, 2009 based on DNI data from DLR-ISIS and IEA Analysis.

***HVDC lines will extend CSP areas***

© IEA/OECD 2010

# Back-up and Hybridisation

- Back-up to « firm » electric capacities,
- Hybridisation to share the costs of the plant (except. solar field)
- SEGS plants in California (25% NG), CSP plants in Spain (10-15%), EAU...
- ISCC plants (with N. Gas): Algeria, Egypt, Iran, Morocco...
- Solar pre-heating of feed water: Australia Florida... (a few %)
- Main steam substitution: towers in supercritical coal plants, from 30% to 70%: *China, India, Morocco, RSA????*

# Solar PV Targets

Off-grid

Commercial

Utility

Residential

Share of global electricity generation in %

***If sound policies are put in place, PV can provide 5% of global electricity generation in 2030, 11% in 2050***

© IEA/OECD 2010

# PV deployment and competitiveness

Source: IEA Solar PV Technology Roadmap

- Thanks to a steep learning curve, deployment-led cost cuts will progressively make residential PV, then utility-scale PV competitive and a cheap GHG mitigation option

# Variable RE in 2050

# Emerging challenges: grid integration

Variability is not new, but it does get bigger

Source: *Western Wind and Solar Integration Study*, GE Energy for NREL (2010)

# Flexibility is key

There are 4 flexible resources

Dispatchable  
power plants

Demand side  
Response  
(via smart grid)

Energy storage  
facilities

Interconnection  
with adjacent  
markets

A biomass-fired  
power plant

A pumped hydro  
facility

Scandinavian  
interconnections

# Current PV boom

Accumulated global PV capacity

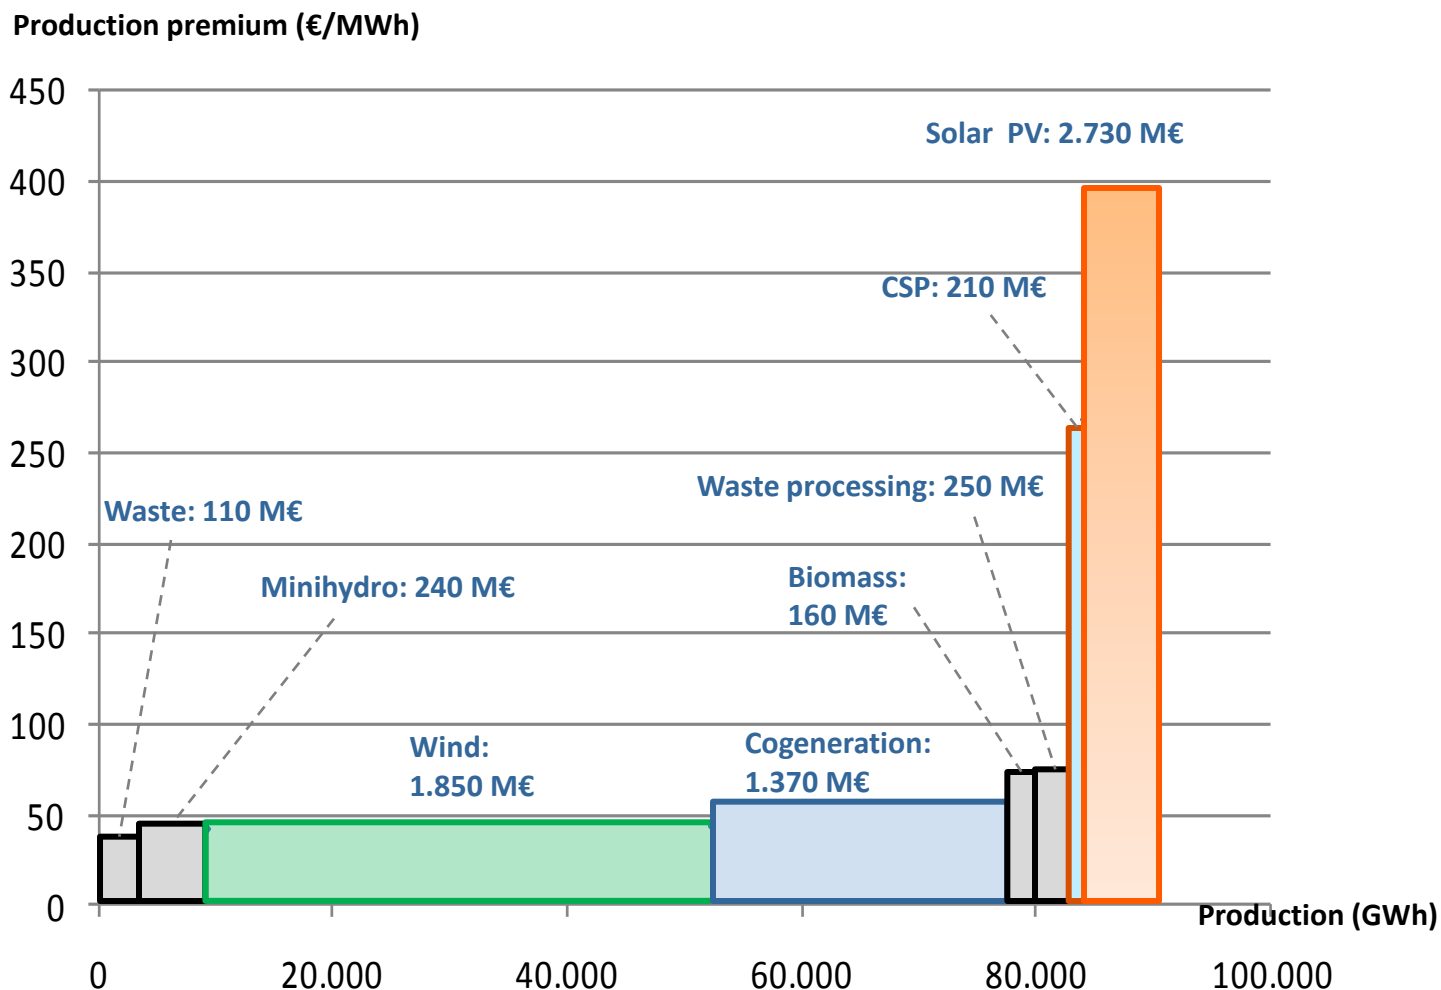

Sources: IEA PVPS, BP Statistical Report, BNEF

- Unexpected PV growth raises policy cost concerns in several EU countries
- Czech Rep., France, Germany, Italy, Spain

# Impacts on total support costs: Spain

## Support received vs. production, 2010

Source: UNESA estimations (September 2010)

# Are incentives following cost reduction quickly enough?

PV learning curve

Source: Breyer and Gerlach, 2010

- Policies are not adapting quickly enough
- Country price differences mainly reflect incentives

# Small-scale systems: Germany 2010

- Difficult to predict and monitor hundreds of thousands of investors

German PV 2010 share of new installed capacity by size of installation

German PV 2010 number of new installations by size

Source: Bundesnetzagentur , 2011

# Will quantity caps be required?

- Controlling overall costs by controlling the level of incentives appear difficult and risky
  - Uncertain and fast-changing costs, large potential
  - Political risks for FITs
  - But Germany may succeed

# Solar heat: the current leader

Total Capacity in Operation [ $\text{GW}_{\text{el}}$ ], [ $\text{GW}_{\text{th}}$ ] and Produced Energy [ $\text{TWh}_{\text{el}}$ ], [ $\text{TWh}_{\text{th}}$ ], 2010

# Solar fuels

Sources:PSI/ETH-Zürich/SundropFuels

- Sundrop Fuels solar-driven biomass gasification
1. Concentrated solar power from mirrors on the ground is directed into the thermochemical reactor, which sits atop a high tower.
  2. Finely ground biomass is delivered by pneumatic tube into a feeder unit above the reactor.
  3. Feedstock is dropped through the reactor's solar furnace, where temperatures of 1,300° Celsius gasify the material.
  4. Synthesis gas (syngas) is collected and delivered to the adjacent biorefinery to create green gasoline or diesel fuels.

*Another possible synergie between solar and coal for RSA: producing liquid fuels with lower CO<sub>2</sub> emissions*

# At global level, government support will continue to grow

## Annual global support for renewables in the New Policies Scenario

*Government support remains the key driver – rising from \$57 billion in 2009 to \$205 billion in 2035 – but higher fossil-fuel prices & declining investment costs also spur growth*

# Solar publication: a primer

- ❑ Publication in September
- ❑ All technologies, all sectors, all countries, all timescales
- ❑ **Markets and Outlook**
  - Electricity
  - Buildings
  - Industry
  - Transport
  - Testing the limits
  - Policies
- ❑ **Technologies**
  - Photovoltaics
  - Heat
  - STE/CSP
  - Solar fuels

# A global approach

- Solar energy has the potential to become the largest source of electricity, and contribute to heating, cooling, process heat, transport fuel
- The bulk of the forthcoming growth of energy demand is in sunny countries
- Solar may also change million lives with access to modern energy services
- Efforts/benefits need to be shared globally
  - “Spend wisely, share widely”
