

# Windows and glazed area technologies and materials in Europe

Bertrand Cazes

GLASS FOR EUROPE

Building, Automotive, Solar-Energy Glass

# About Glass for Europe

- 4 member companies and 1 associate:
  - Run 58 of the 67 float lines based in the EU & EU candidate countries
  - Above 90% of the EU production

In association with:

- Flat glass:
  - Primarily building, automotive & solar-energy glass
  - Also furnitures, electronics, appliances
- Supporter of building energy-efficiency

# The myths to abandon

‘Windows are weak points in the building envelopes’

No longer true!

‘This is the house of the future’

Really efficient? Really the comfortable living space expected?

# Properties of windows

Energy efficiency of windows is the balance between heat loss and solar heat gain

Energy balance:  
 $\alpha \times Ug - \beta \times g$

Low E coatings are transparent to solar radiation:

→ Increase of solar Heat gain: g value

Low E coatings stop exchange by radiation:

→ Reduction of Heat Loss: Ug value

# A new energy-efficiency picture

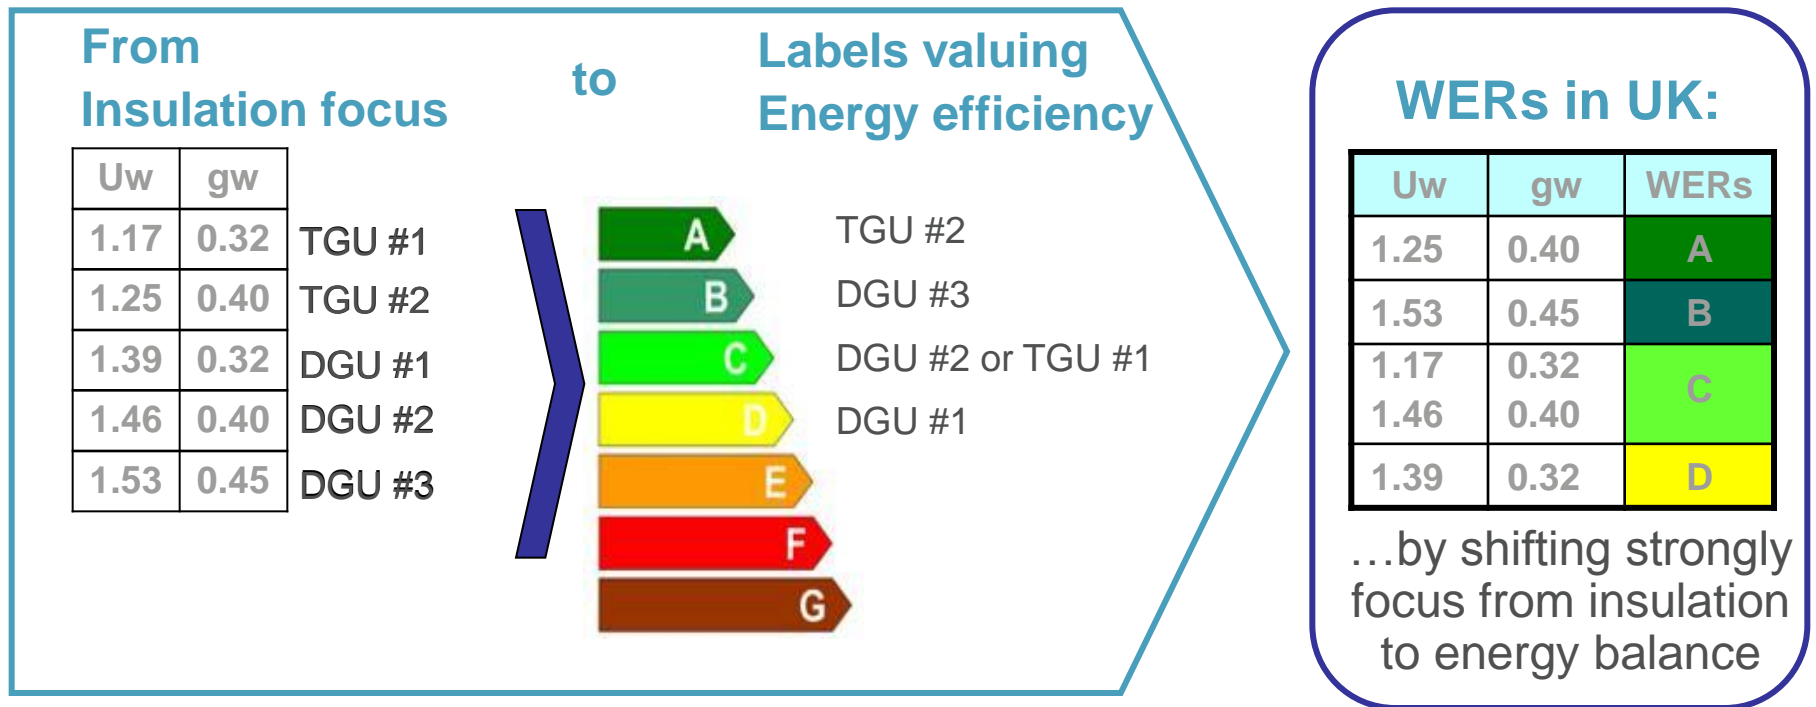

Ability to capture free solar heat gain is **unique**  
High performance windows could soon become **energy positive**

# The sound policy basis

## UK – Window Energy Rating scheme

→ *Providing easily understandable information to consumers on the energy performance of products, expressed by way of labeling.*

No longer about the sole U value but the energy balance

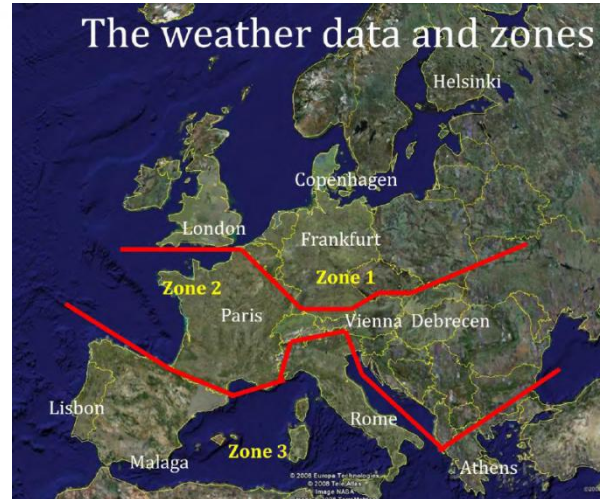

→ *Same principles in Denmark, Finland, Czech Republic and Slovakia*

GLASS FOR EUROPE

# Different parameters to consider

## POLICY MAKING

**New Build** or  
**Renovation ?**

**Residential** or **Commercial ?**

# Impact of the orientation

- Orientation primarily impact solar heat gains
- Triple Glazed units with high solar factor can be more energy efficient than walls, even in the North orientations

# Climates in the equation

UK Rating Method based on energy balance between losses and gains:

$$\text{Energy Index} = 218.6 \text{ gw} - 68.5 (Uw + L50)$$

**Energy index:** energy saved or lost by the window

**gw:** solar factor of the window (glass fraction \* glass solar factor)

**Uw:** U value of the window calculated by BFRC Certified Simulators (EN 10077-2)

**L50:** effective heat loss due to air penetration.

Level	E index
A	>0
B	-10 TO <0
C	-20 to < -10
D	-30 to < -20
E	-50 to < -30
F	-70 to < -50
G	< -70

**218.6:** fractions to reflect the solar heat gains based on climatic conditions

**68.5:** fractions to reflect the heat losses based on climatic conditions

Formulae adapted to countries' climatic conditions

# WER systems in Europe

## SWEDEN

Based on  $U_w$  values only  
A if  $U_w = 0.9 \text{ W/m}^2\text{K}$   
G if  $U_w = 1.5 \text{ W/m}^2\text{K}$

## DENMARK

$E_{\text{ref}} = 196.4 \cdot g_w - 90.36 \cdot U_w$   
A if  $E_{\text{ref}} > 0 \text{ kWh/m}^2$   
C if  $-17 > E_{\text{ref}} \geq -34 \text{ kWh/m}^2$   
MINI Band C compulsory

## UK

$E_{\text{ref}} = 218 \cdot g_w - 68.5 \cdot (U_w + L_{50})$   
A if  $E_{\text{ref}} > 0 \text{ kWh/m}^2$   
G if  $E_{\text{ref}} < -70 \text{ kWh/m}^2$   
MINI Band C compulsory

## FRANCE

Under development  
3 zones based on energy consumption of the building

## SPAIN

Under development  
Takes into account energy for heating and cooling

## ITALY

Under development  
Will be the first with limitation on solar factor

## FINLAND

$E_{\text{ref}} = 140 \cdot u_w - 160 \cdot g_w + 50 \cdot L$   
A if  $E_{\text{ref}} < 85 \text{ kWh/m}^2$   
G if  $E_{\text{ref}} \geq 185 \text{ kWh/m}^2$

## CZECH REP.

$E_{\text{ref}} = 282.4 \cdot g_w - 98.7 \cdot (U_w + L_w)$   
A if  $E_{\text{ref}} > 0 \text{ kWh/m}^2$   
G if  $E_{\text{ref}} < -100 \text{ kWh/m}^2$

## SLOVAKIA

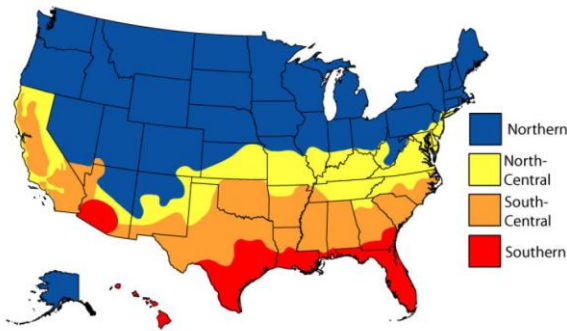

$E_{\text{ref}} = 266.6 \cdot g_w - 96.6 \cdot (U_w + L_w)$   
A if  $E_{\text{ref}} > 0 \text{ kWh/m}^2$   
G if  $E_{\text{ref}} < -100 \text{ kWh/m}^2$

When WER is developed based on energy balance, it is adapted to local realities!

# Variances & refinement possible

ENERGY STAR Program Requirements for Windows, Doors, and Skylights: Version 5.0 (April 7, 2009)

NFRC certification of the U-Factor & Solar Heat Gain Coefficient (SHGC)  
→ Levels must meet or exceed the minimum qualification criteria

Climate Zone	Windows		
	U-Factor <sup>1</sup>	SHGC <sup>2</sup>	
Northern	≤ 0.30	Any	Prescriptive
	≥ 0.31	≥ 0.35	Equivalent Energy Performance
	≥ 0.32	≥ 0.40	
North-Central	≤ 0.32	≤ 0.40	
South-Central	≤ 0.35	≤ 0.30	
Southern	≤ 0.60	≤ 0.27	

<sup>1</sup> Btu/h.ft<sup>2</sup>.°F

<sup>2</sup> Fraction of incident solar radiation

## Proposal for a labeling of windows

- Based on the global energy consumption of the building (both U and g values for windows)
- Three climatic zones
- Indication of summer comfort (prevention of over-heating).

## Labeling under development

- Likely to include limitation on solar factor to avoid heat build-up in summer
- Solar-control glass may provide the best energy balance.

GLASS FOR EUROPE

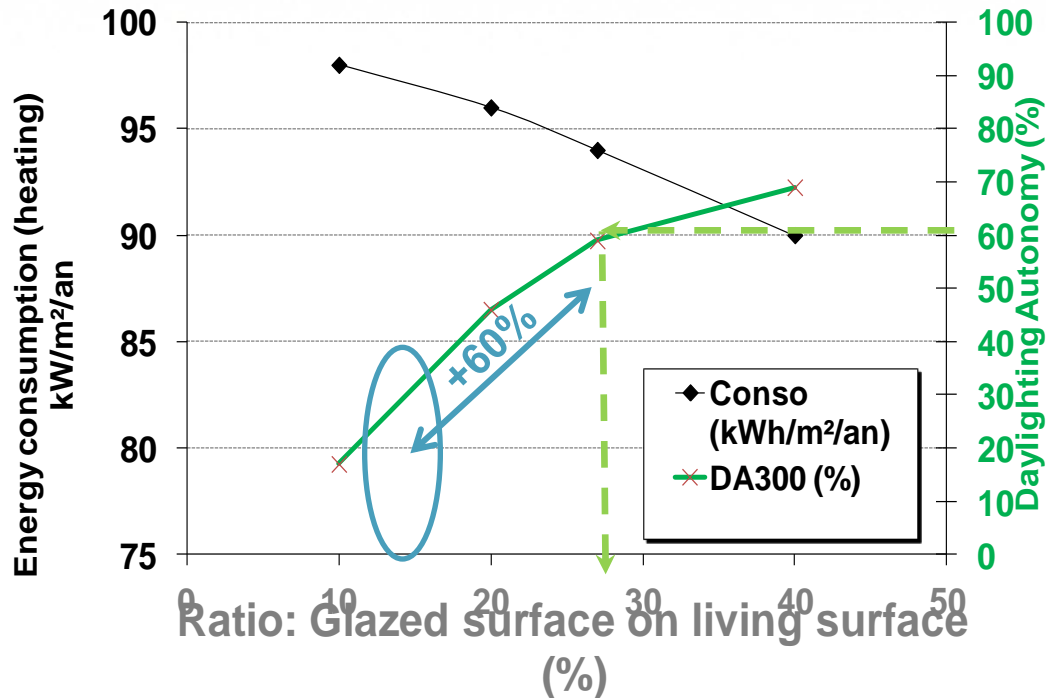

# Solar heat gains to be optimized

**In most climates enlarging size of performing windows helps to reduce energy consumption**

# Glazing areas can be increased

DA = % of the day (8-18h), during which the natural light in the house is higher than 300 LUX.

For indication, in France, new residential buildings must have a minimum glazed surface of 18%.

This is still very far below the optimum for energy efficiency AND natural daylight!

# Way to reduce artificial lighting

- As buildings become more efficient, **lighting becomes the most important consumer of energy** in buildings
- Electricity remains one of the most **carbon intensive** form of energy
- **Regulatory requirements and standards:**
  - **EU EPBD directive:** Nearly Zero Energy Buildings - *to become the norm as of 2020* - lighting included in energy demand (office buildings).
  - **Passive Haus:** electricity for lighting and appliances have to be minimised (German standard)
  - Proposal for a criterion on 'daylight availability' for the **EU Ecolabel for office buildings**
  - **Active House:** daylight factor > 5% on average
  - Need to envisage criterion on **daylight autonomy**

→ Easiest answer is Daylight thanks to glazed areas

**Comfort**  
**Well-being**  
**Health**  
**Productivity**  
**Aesthetics**

## Hopefully, the myths are dead! It's time to build differently with a holistic energy balance approach

- Energy efficiency of windows must take into account **thermal losses** AND **solar heat gains**
  - Calculation should be based on a robust methodology
  - Different climatic conditions with direct impact on energy consumption of the building.
  - Artificial lighting through Daylighting autonomy should be part of the energetic performance of the window
  - NEXT STEP: properly take account of the orientation and size of windows in addition to the location

# Thank you!

GLASS FOR EUROPE

Building, Automotive, Solar-Energy Glass

**Many tools are available**  
[www.glassforeurope.com](http://www.glassforeurope.com)

Also based on  $U_w$  and  $g_w$  for heating and cooling

- Energy consumption modelling of three different size houses equipped with 17 windows using Accurate software
- Energy performance of the window is expressed using a 5 stars scales rating for heating and cooling
- Indicative percentage of improvements compared to reference 'model' house
- WERS ratings are designed to 'plug in' to NatHERS, Australia's Nationwide House Energy Rating Software.

	
XYZ Company	
WERS_03_005 Timber Frame - 6.38LE	
<b>ENERGY PERFORMANCE RATINGS - NFRC-100 RESULTS</b>	
U-value	Solar Heat Gain Co-efficient
3.7	0.41
<b>ADDITIONAL PERFORMANCE RATINGS</b>	
Visible transmittance	Air infiltration L/s m <sup>2</sup>
0.47	5.0
<b>COMPARATIVE HOUSE ENERGY SAVINGS*</b>	
33% better for heating	52% better for cooling
<small>*Where compared to the base case window (WERS generic window 1). Actual heating and cooling outcomes may vary with house design, orientation and occupant lifestyle.</small>	
<small>This product complies with Australian Standard 2847:1999</small>	
<small>WERS was established in 1995 and data is calculated using WERS software developed with the co-operation of the Australian Greenhouse Office (AGO), Australian Glass and Glazing Association (AGGA) and the Australian Window Association (AWA). The computer modelling software is the same as that used by the U.S. National Fenestration Rating Council (NFRC) and results are generated to the NFRC Environmental Conditions. Results are for the total window system.</small>	
<small>www.wers.net</small>	

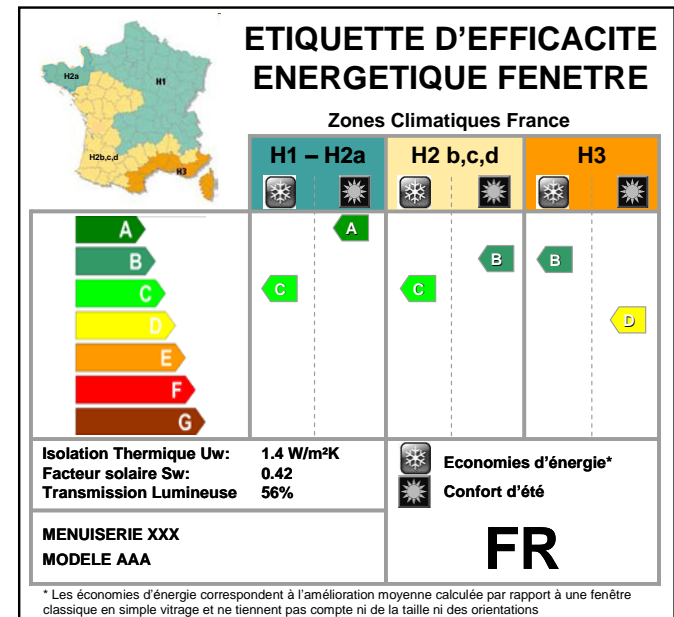

# France's labeling under preparation

- Energy consumption is calculated with TRNSYS software using 96 different types of windows
- Multi-linear regression are used to evaluate energy consumption of building only using window parameters:  $U_w$  and  $g_w$
- Energy ranking is based on improvement compared to a single glazed window
- Summer comfort is related to potential air-conditioning consumption

# Scale of the challenge in EU

- Over 85% of inefficient glazing surfaces in Europe's buildings
- Over 100 million tonnes of CO<sub>2</sub> to be saved annually.

\* According to three different scientific studies carried by the Dutch independent research institute TNO.

# Legislations can help!

## Graph showing impact of new UK Building Regulations for energy conservation, April 2002

Minimum mandatory requirements can have a dramatic affect on the market for added-value glass, as was shown in the UK when low E glass became mandatory for all replacement windows in 2002. The recast EPBD will require national governments to introduce legislation requiring “cost optimal” standards of replacement windows.

→ Importance of proper minimum energy performance requirements for components being replaced (i.e. Cost-optimality in EU recast EPBD)

# Labeling and more...

Information to consumer

Basis for minimum performance requirements in building regulations

Basis to grant financial incentives / tax returns
